2.1 WAN Technologies Overview

Purpose of WANs

Why Choose a WAN?

- Operates beyond the geographic scope of a LAN
- Used to interconnect the enterprise LAN to remote LANs in branch sites and telecommuter sites
- Owned by a service provider
- Organization must pay a fee to use the provider's services to connect sites

Purpose of WANs

Are WANs Necessary?

Businesses require communication among geographically separated sites. Examples include:

- Regional or branch offices must be able to communicate and share data.
- Organizations must share information with other customer organizations.
- Mobile workers must access information that resides on corporate networks.

Home computer users must send and receive data across increasingly larger distances. Examples include:

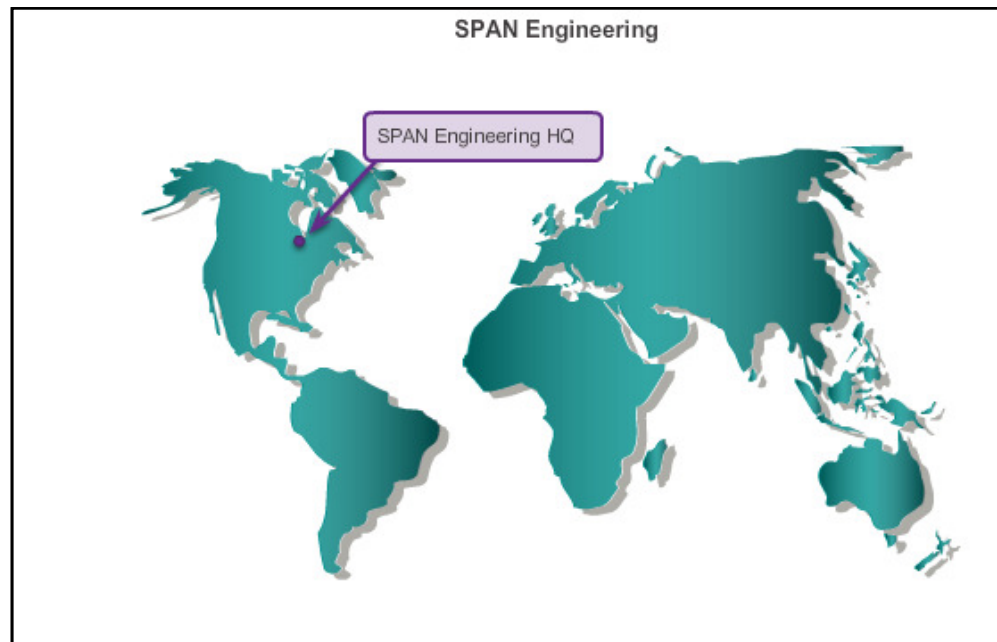

- Consumers communicate over the Internet with banks, stores, and a variety of providers of goods and services.
- Students do research by accessing library indexes and publications located in other parts of the country and in other parts of the world.

Purpose of WANs

Evolving Networks

- Companies expect their networks to perform optimally and to be able to deliver an ever increasing array of services and applications to support productivity and profitability.
- SPAN Engineering – example used in the curriculum

Purpose of WANs

Small Office

SPAN Engineering – Environmental Consulting Firm

- Been in business for four years, has grown to include 15 employees: six engineers, four computer-aided drawing (CAD) designers, a receptionist, two senior partners, and two office assistants
- Uses a single LAN to share information between computers, and to share peripherals, such as a printer, a large-scale plotter, and fax equipment
- Upgraded LAN to provide inexpensive VoIP service to save on the costs of separate phone lines for their employees
- Connection to the Internet is through a common broadband service called DSL
- Uses support services purchased from the DSL provider
- Uses a hosting service rather than purchasing and operating its own FTP and email servers

Purpose of WANs

Campus Network

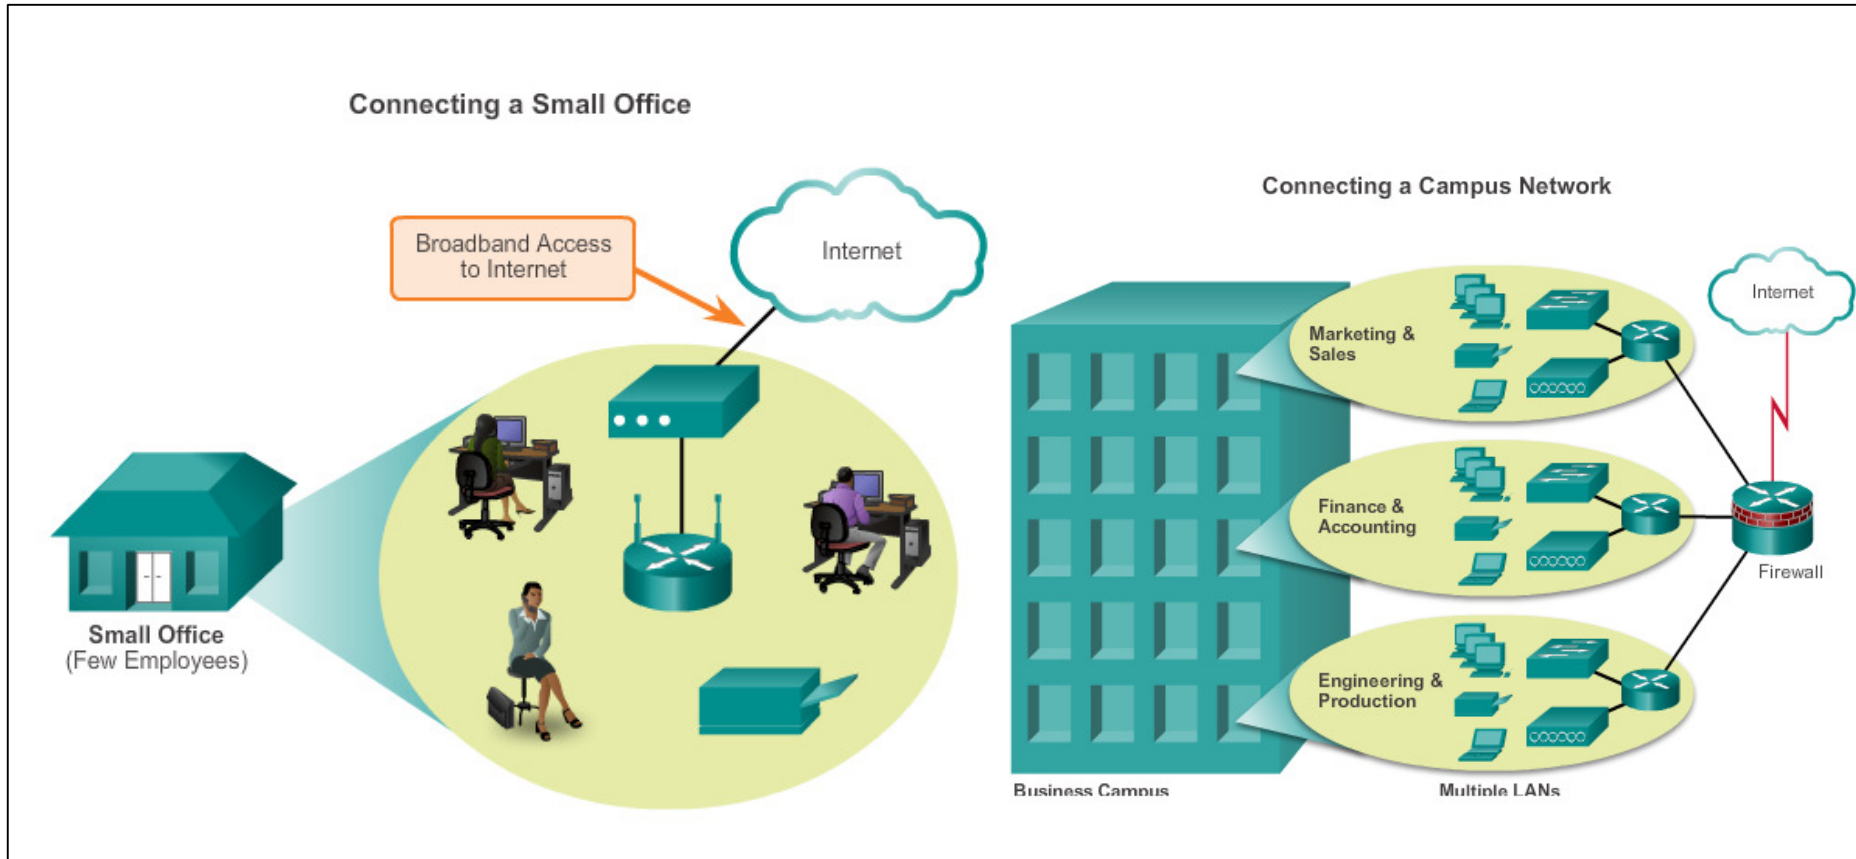

SPAN Engineering – Environmental Consulting Firm

- Five years later has grown rapidly.
- Contracted to design and implement a full-sized waste conversion facility.
- Won other projects in neighboring municipalities and in other parts of the country.
- Hired more staff and leased more office space with several hundred employees, organized itself into functional departments.
- Network now consists of several subnetworks, each devoted to a different department.
- Multiple LANs are joined to create a company-wide network or campus, which spans several floors of the building.

Purpose of WANs

Small Office – Campus Network

Purpose of WANs

Branch Networks

- Another six years later, SPAN Engineering demand for its services has skyrocketed.
- To manage those projects, the company has opened small branch offices closer to the project sites.
- SPAN Engineering now has a data center, which houses the various databases and servers of the company. They must now implement a WAN.
- For its branch offices that are in nearby cities, the company decides to use private dedicated lines through their local service provider.
- For those offices that are located in other countries, the Internet is an attractive WAN connection option.
- Although connecting offices through the Internet is economical, it introduces security and privacy issues that the IT team must address.

Purpose of WANs

Branch Networks (cont.)

Purpose of WANs

Distributed Networks

- SPAN Engineering has now been in business for 20 years and has grown to thousands of employees distributed in offices worldwide.
- Cost of the network and its related services is a big expense.
- Looking to provide the best network services at the lowest cost.
- Encouraging teleworking and virtual teams, web-based applications are being used to increase productivity and reduce costs.
- Site-to-site and remote access Virtual Private Networks (VPNs) enable the company to use the Internet to connect easily and securely with employees and facilities around the world.

Purpose of WANs

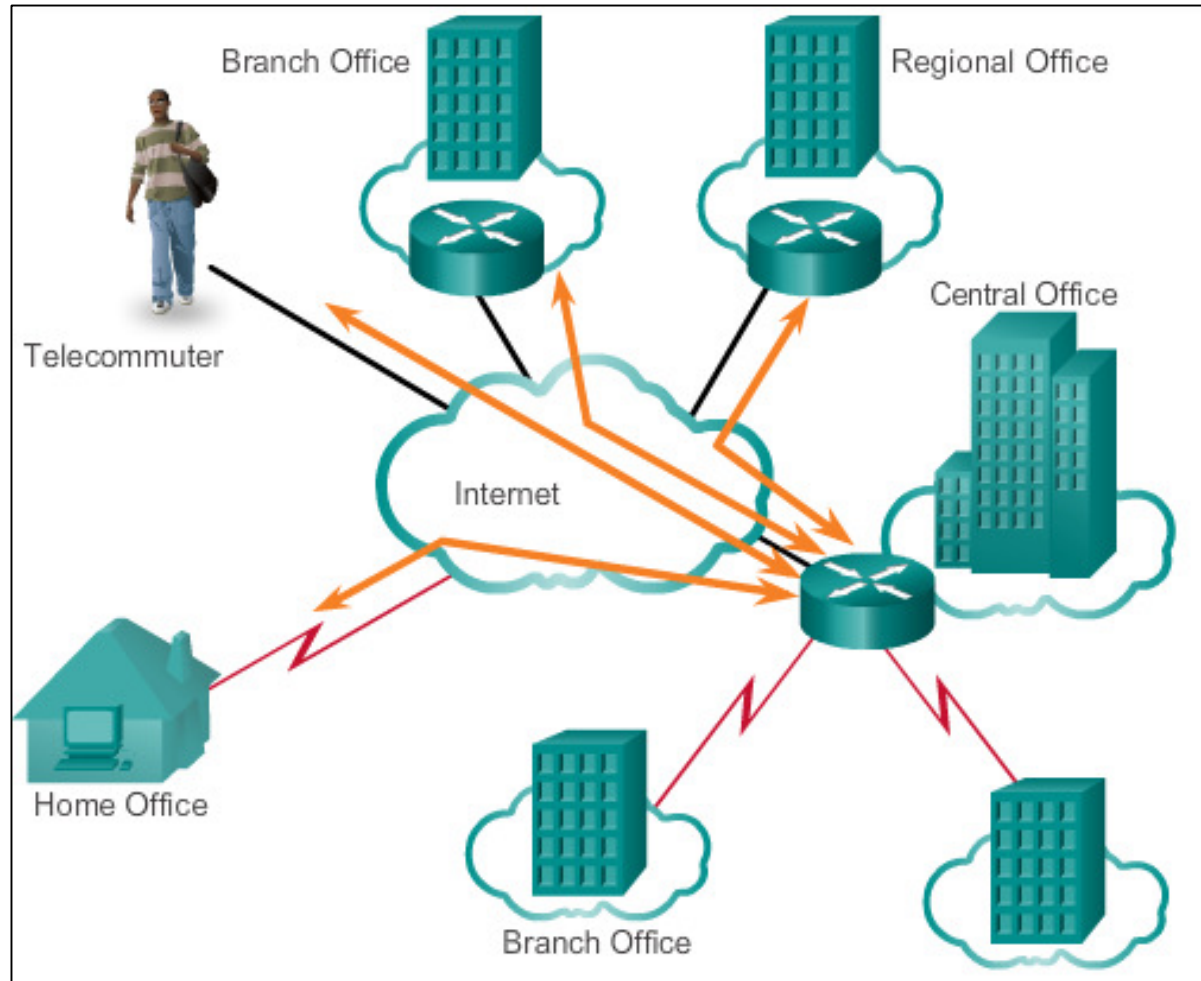

Distributed Networks (cont.)

- Network requirements can change dramatically as the company grows.
- Distributing employees saves costs in many ways, but it puts increased demands on the network.
- Network must be able to adapt and grow as the company changes.
- Network designers and administrators meet these challenges by carefully choosing network technologies, protocols, and service providers, and by optimizing their networks.

WAN Operations

WAN Operations

WAN Devices

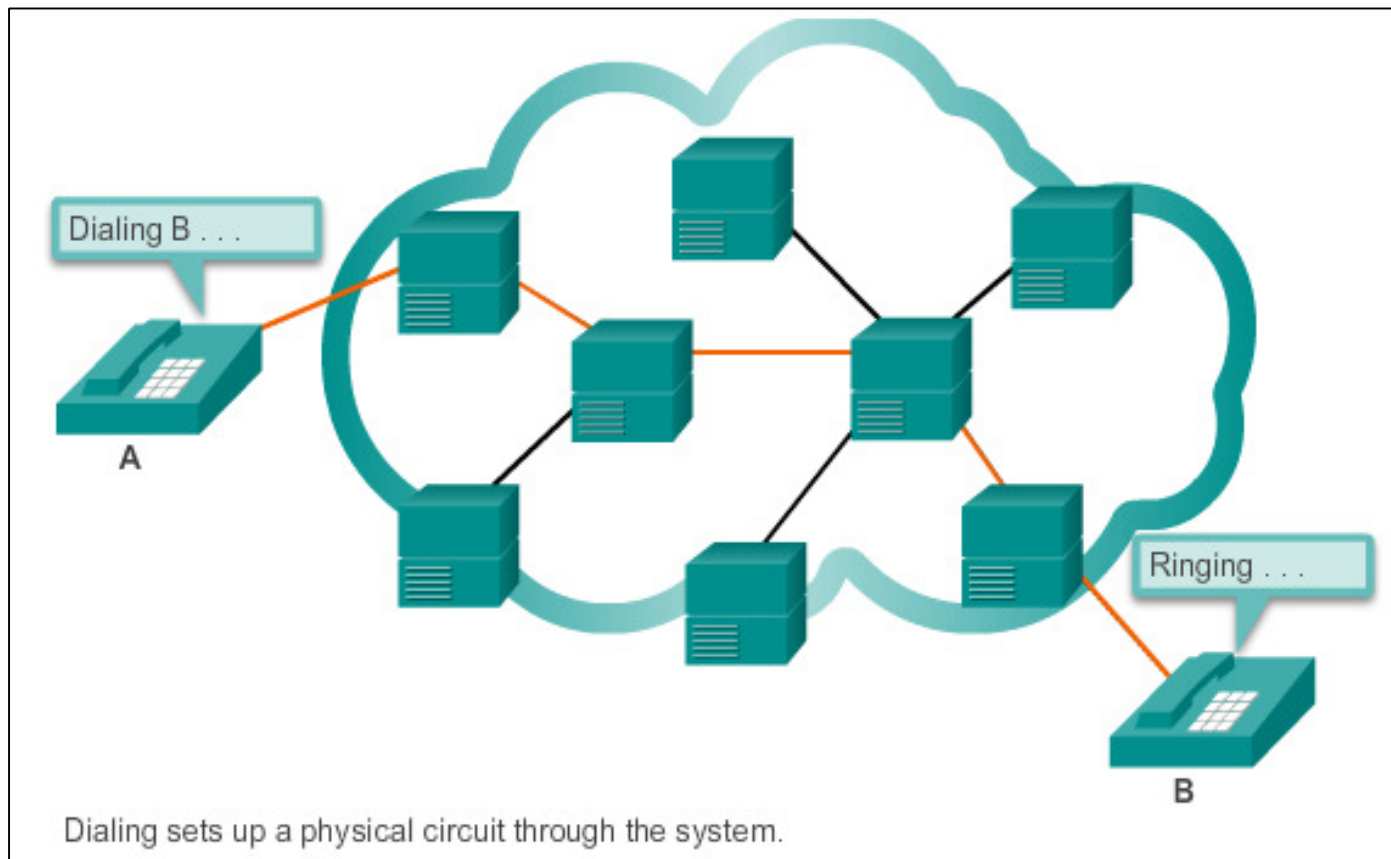

WAN Operations

Circuit Switching

The two most common types of circuit-switched WAN technologies are the public switched telephone network (PSTN) and the Integrated Services Digital Network (ISDN).

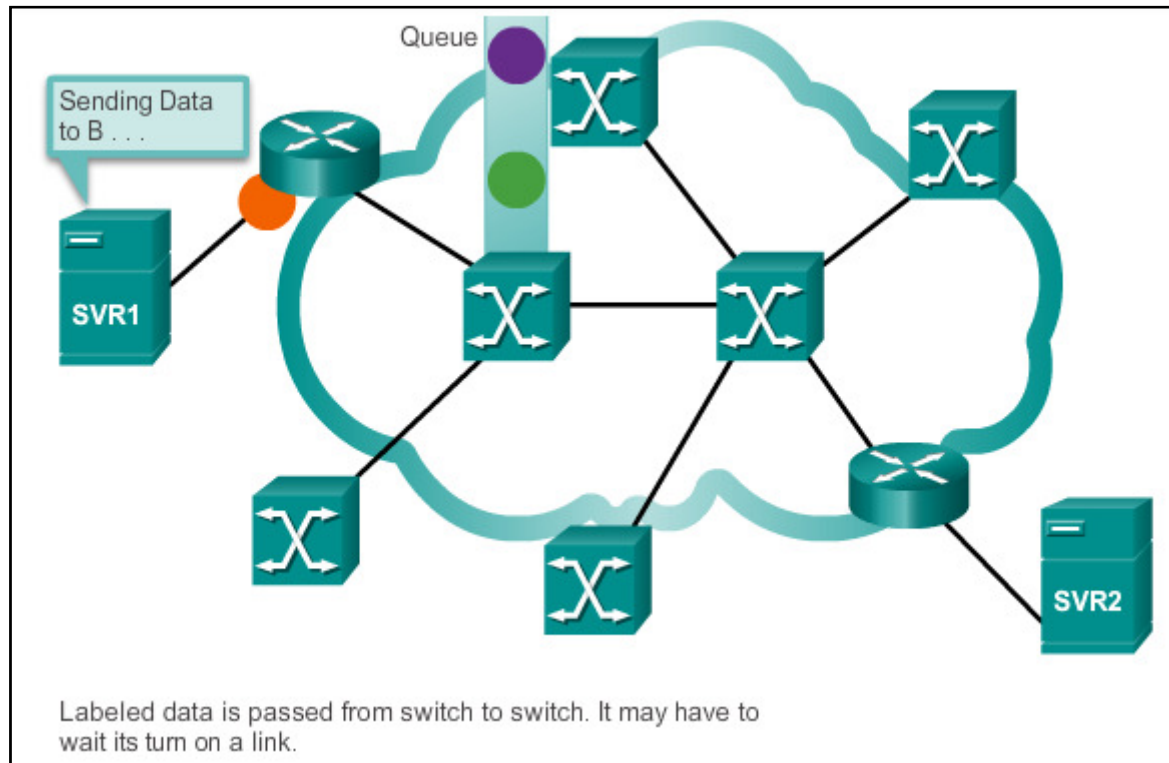

WAN Operations

Packet Switching

Splits traffic data into packets that are routed over a shared network. Packet-switching allow many pairs of nodes to communicate over the same channel.

WAN Services

WAN Link Connection Options

WAN Services

Service-Provided Network Infrastructure

Private WAN Infrastructures

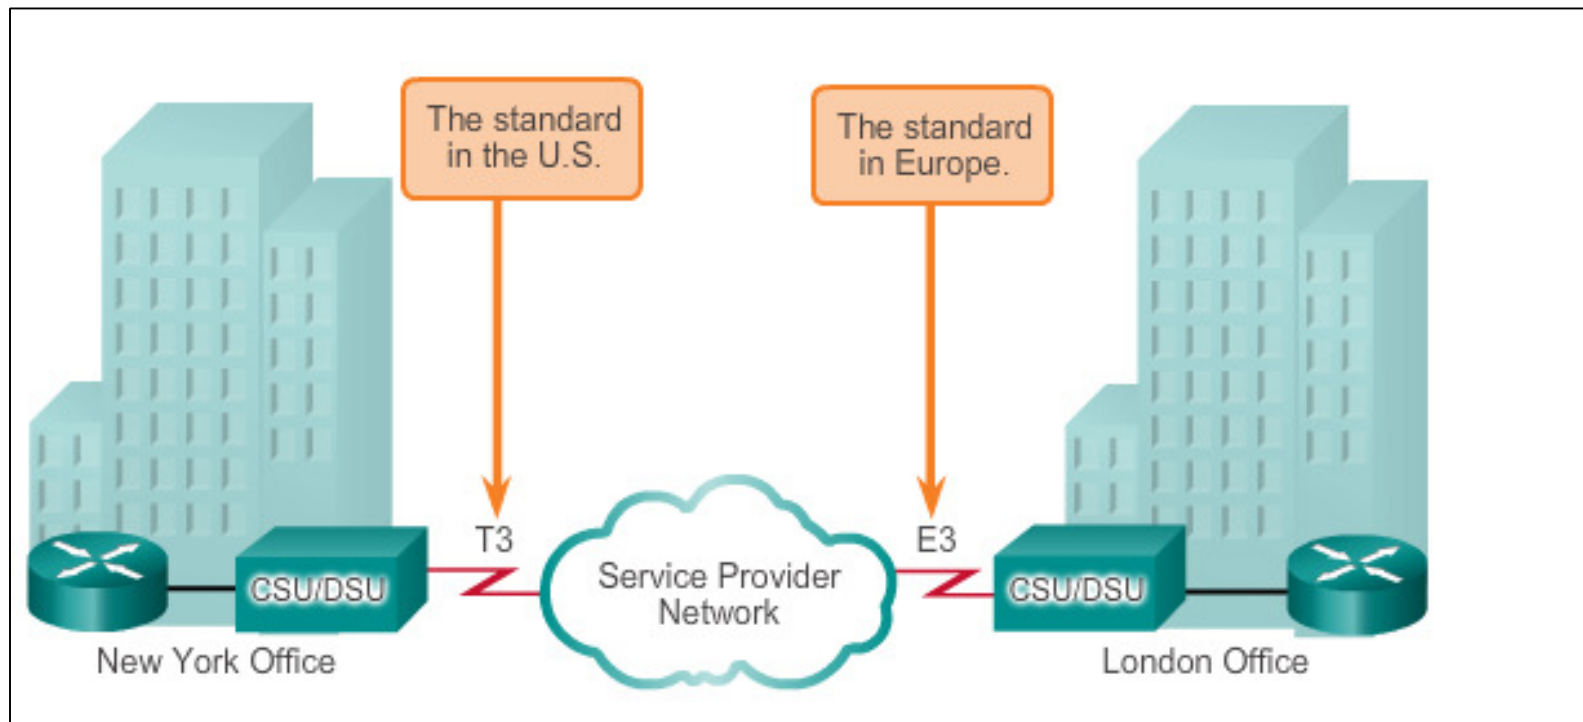

Leased Lines

Advantages:

- Simplicity
- Quality
- Availability

Disadvantages:

- Cost
- Limited flexibility

Private WAN Infrastructures

Dialup

Advantages:

- Simplicity
- Availability
- Low implementation cost

Disadvantages:

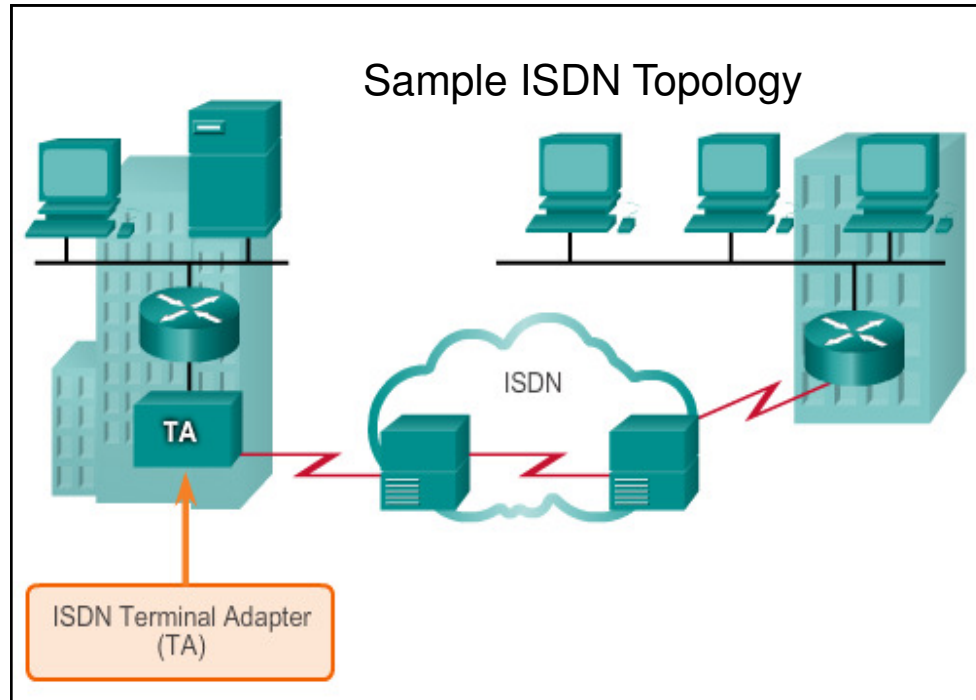

- Low data rates
- Relatively long connection time

Private WAN Infrastructures

ISDN

Private WAN Infrastructures

Frame Relay

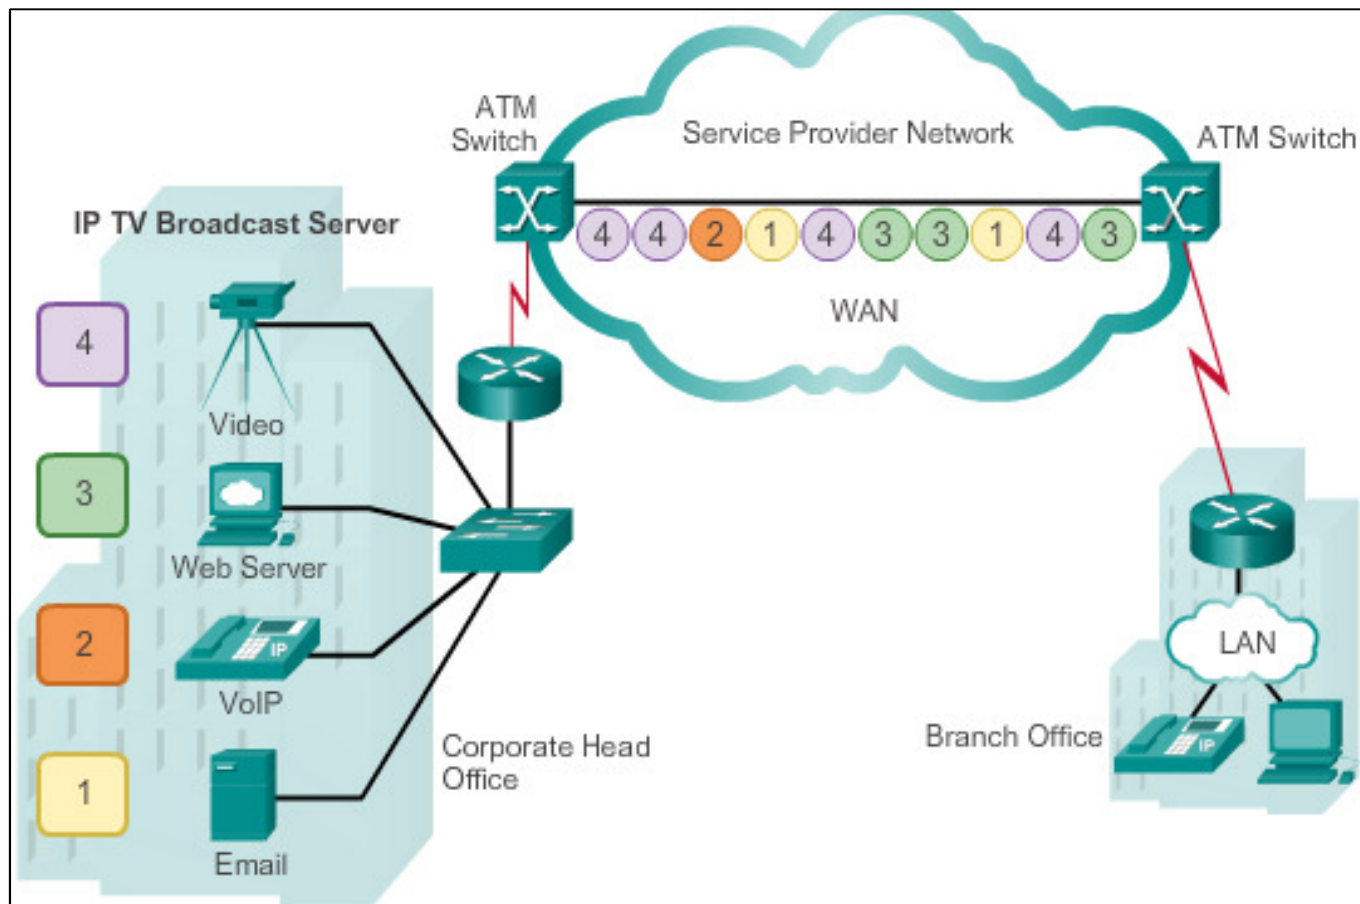

- PVCs carry both voice and data traffic.
- PVCs are uniquely identified by a data-link connection identifier (DLCI).
- PVCs and DLCIs ensure bidirectional communication from one DTE device to another.
- R1 uses DLCI 102 to reach R2 while R2 uses DLCI 201 to reach R1.

Private WAN Infrastructures

ATM

Built on a cell-based architecture, rather than on a frame-based architecture. ATM cells are always a fixed length of 53 bytes.

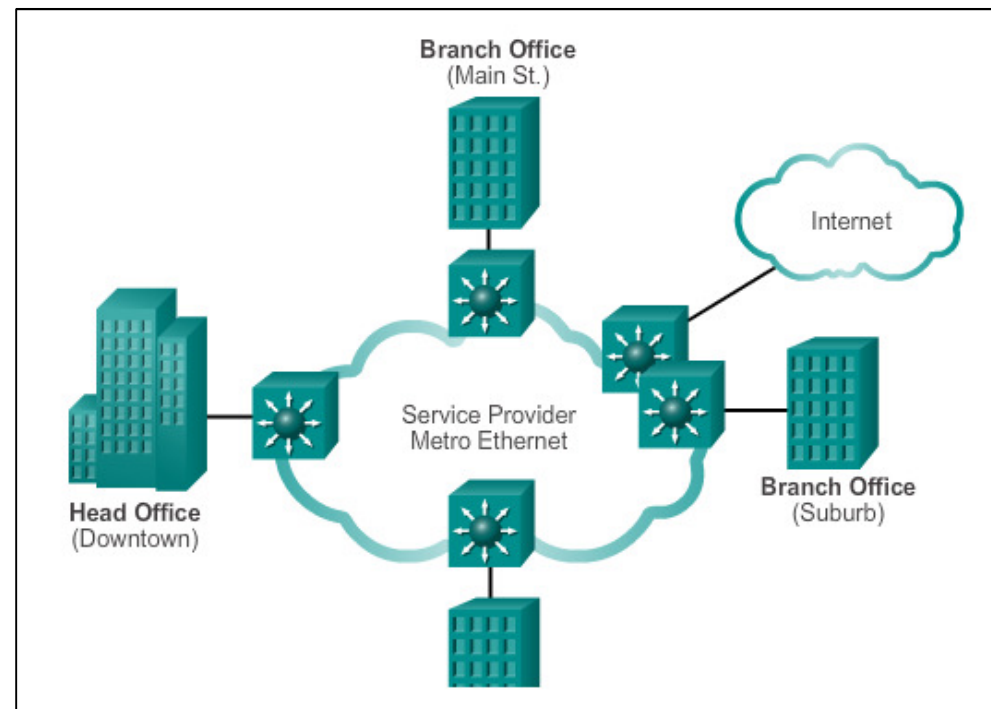

Private WAN Infrastructures

Ethernet WAN

Features and Benefits of Ethernet WAN include:

- Reduced expenses and administration
- Easy integration with existing networks
- Enhanced business productivity
- Service providers now offer Ethernet WAN service using fiber-optic cabling.
- Known as Metropolitan Ethernet (MetroE), Ethernet over MPLS (EoMPLS), and Virtual Private LAN Service (VPLS).

Note: Commonly used to replace the traditional Frame Relay and ATM WAN links.

Private WAN Infrastructures

MPLS

Multiprotocol Label Switching (MPLS) is a multiprotocol high-performance WAN technology that directs data from one router to the next, based on short path labels rather than IP network addresses.

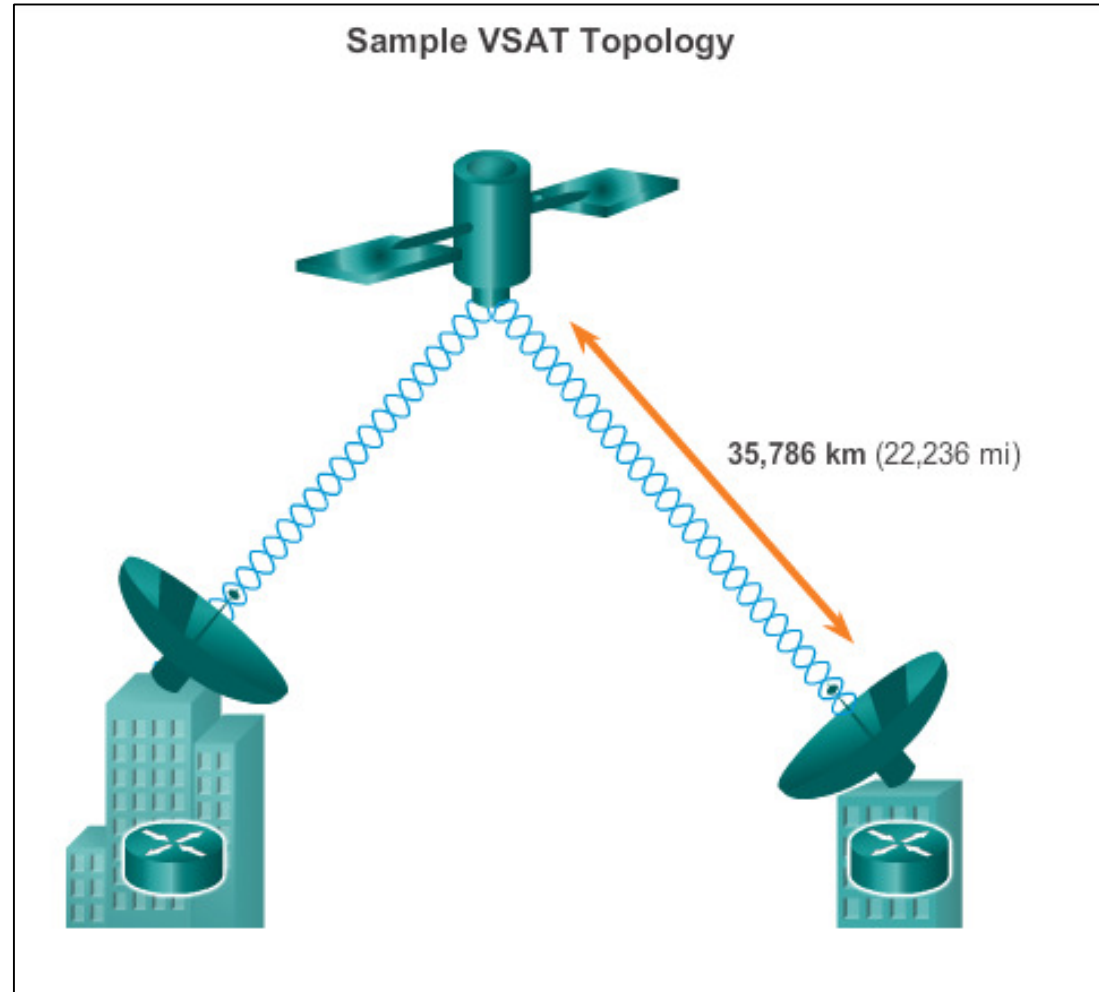

Private WAN Infrastructures

VSAT

Very small aperture terminal (VSAT) - a solution that creates a private WAN using satellite communications.

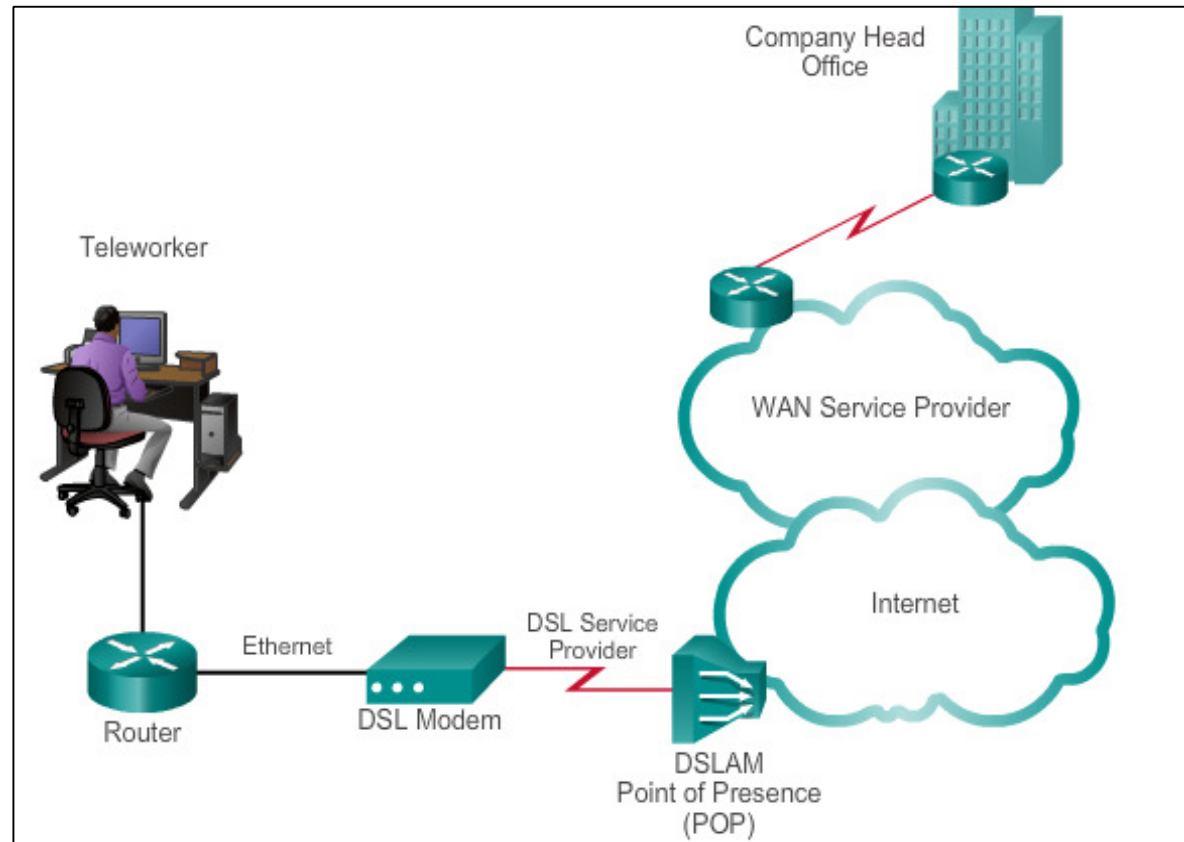

Private WAN Infrastructures

DSL

- Always-on connection technology that uses existing twisted-pair telephone lines to transport high-bandwidth data, and provides IP services to subscribers.
- A DSL modem converts an Ethernet signal from the user device to a DSL signal, which is transmitted to the central office.

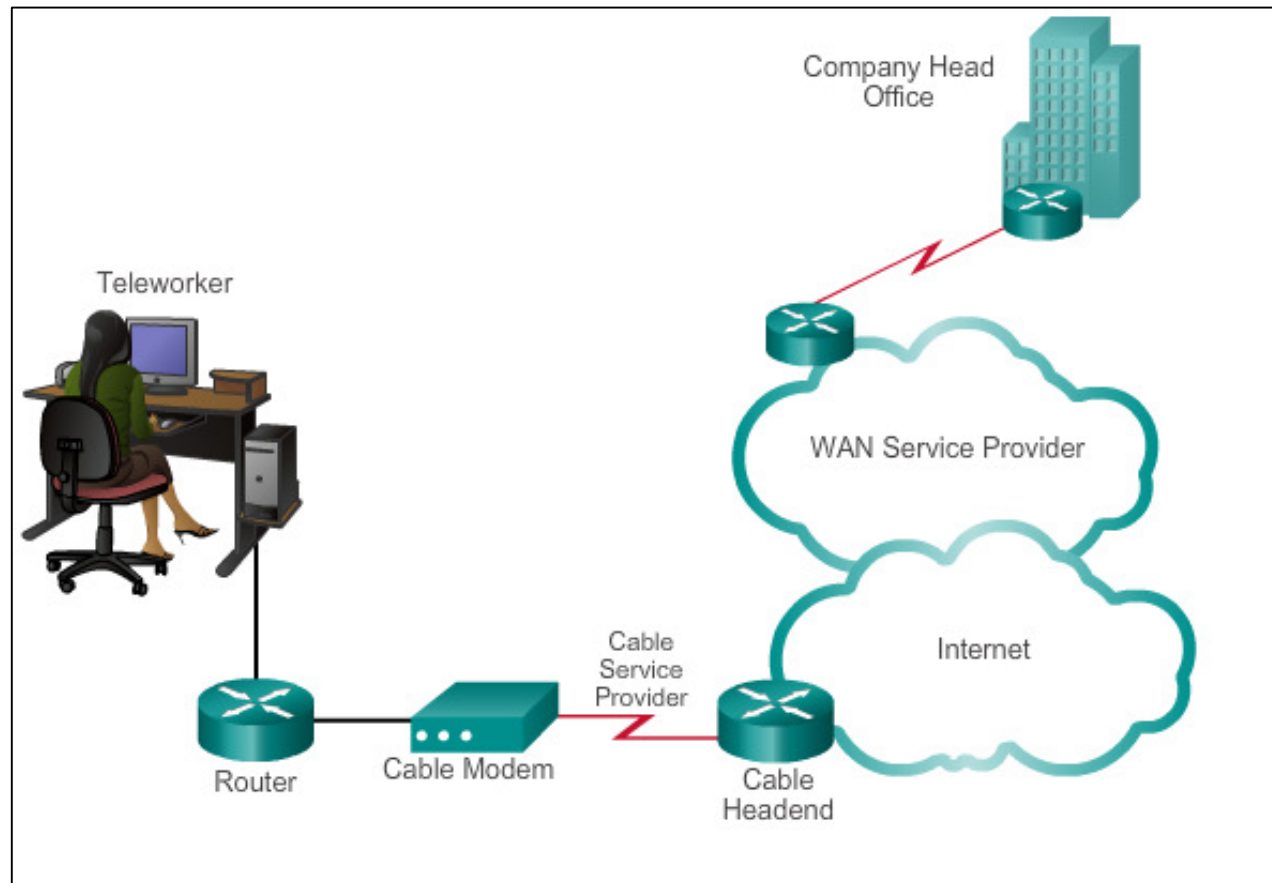

Private WAN Infrastructures

Cable

- Network access is available from some cable television networks.
- Cable modems provide an always-on connection and a simple installation.

Private WAN Infrastructures Wireless

New developments in broadband wireless technology:

- **Municipal Wi-Fi** – Many cities have begun setting up municipal wireless
- **WiMAX** – Worldwide Interoperability for Microwave Access (WiMAX) is a new technology that is just beginning to come into use.
- **Satellite Internet**

Sample Wireless Topology

Private WAN Infrastructures

3G/4G Cellular

Common cellular industry terms include:

- **3G/4G Wireless** – Abbreviation for 3rd generation and 4th generation cellular access. These technologies support wireless Internet access.
- **Long-Term Evolution (LTE)** – A newer and faster technology, considered to be part of the 4th generation (4G) technology.

Private WAN Infrastructures VPN Technology

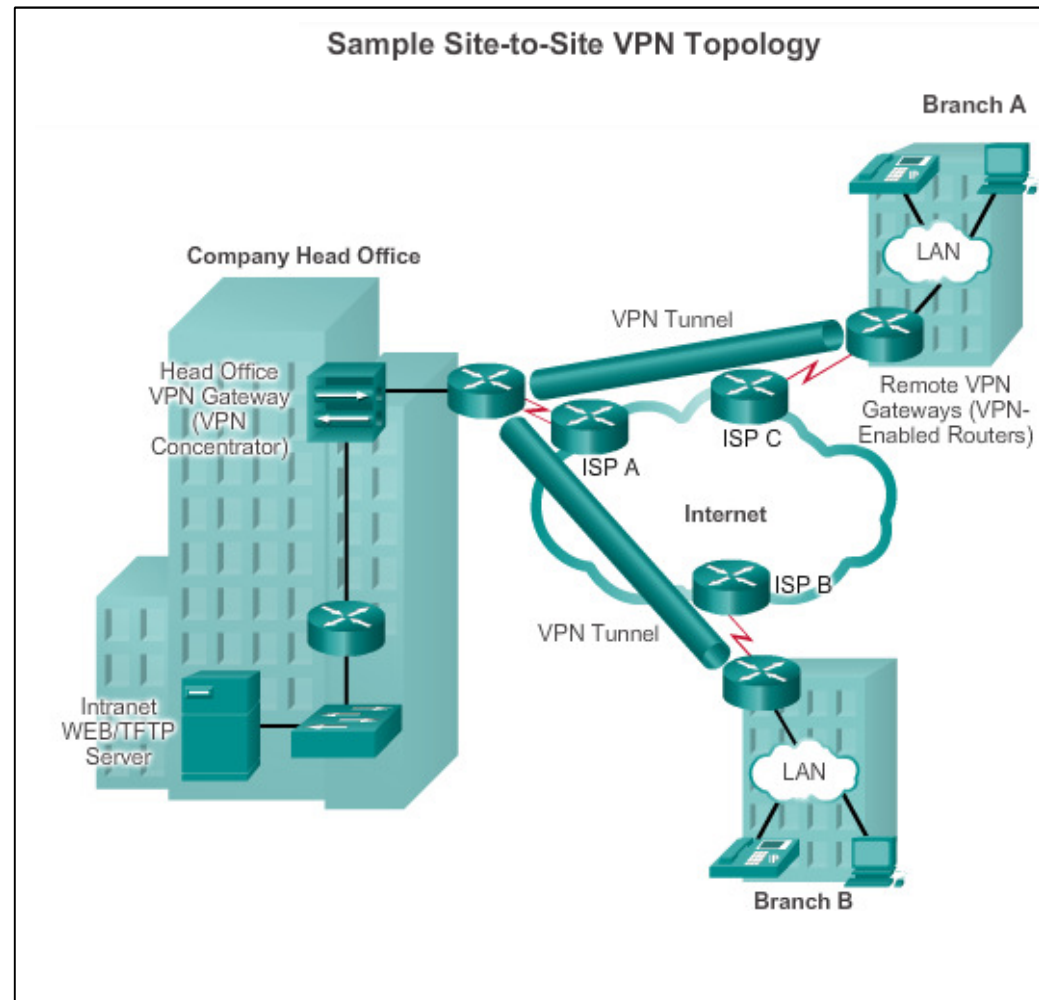

VPN is an encrypted connection between private networks over a public network.

Benefits:

- Cost savings
- Security
- Scalability
- Compatibility with broadband technology

Two types of VPN:

- Site-to-site VPNs
- Remote-access VPNs

Selecting WAN Services

Choosing a WAN Link Connection

Answer the following questions when choosing a WAN Connection:

- What is the purpose of the WAN?
- What is the geographic scope?
- What are the traffic requirements?

Selecting WAN Services

Choosing a WAN Link Connection

- Should the WAN use a private or public infrastructure?
- For a private WAN, should it be dedicated or switched?
- For a public WAN, what type of VPN access is required?
- Which connection options are available locally?
- What is the cost of the available connection options?

2.3 Summary

Cisco | Networking Academy®
Mind Wide Open™

Chapter 2: Summary

- A business can use private lines or the public network infrastructure for WAN connections.
- WAN access standards operate at layers 1 and 2 of the OSI model, and are defined and managed by the TIA/EIA, ISO, and IEEE.
- A WAN may be circuit-switched or packet-switched.
- There is common terminology used to identify the physical components of WAN connections and who, the service provider or the customer, is responsible for which components.
- Service provider networks are complex and the service provider's backbone networks consist primarily of high-bandwidth fiber optic media.

Chapter 2: Summary (cont.)

- Permanent, dedicated point-to-point connections are provided by using leased lines.
- Public infrastructure connections include DSL, cable, wireless, and 3G/4G cellular.
- Security over public infrastructure connections can be provided by using remote-access or site-to-site VPNs.
