IP Training Programme

HOUSE OF
TECHNOLOGY

an dds of mercontec*

Module 1: IP Generic Session 1: Basic networking

Basic Networking

HOUSE OF
TECHNOLOGY

an dds of mercontec*

- Numeric systems and bits and Bytes.
- Ethernet (MAC Address etc.).
- The IP Address/Subnet mask.
- ARP: Binding the MAC and IP address together.
- Switching.
- VLAN.
- Default Gateway and basic Routing.
- Exercises during session:
 - Find your own MAC and IP address.
 - Commands: ipconfig, ping and traceroute.
- Virtual Learning Environment task:
 - Configuring static IP addresses, subnet masks and default gateways.

NUMERIC SYSTEMS BITS AND BYTES

A fatal exception 0E has occurred at 0028:C0011E36 in UXD UMM(01) 00010E36. The current application will be terminated.

* Press any key to terminate the current application.
 * Press CTRL+ALT+DEL again to restart your computer. You will lose any unsaved information in all applications.

Press any key to continue _

Numeric systems

- $B_{16} = 11_{10}$
 - 16 = hexadecimal
 - 10 = decimal
- $B_{16} = 1011_2$
- $A6_{16} = 10100110_2$
- $B6_{16} = 182_{10}$
 - $B_{16} = 11_{10}$
 - $6_{16} = 6_{10}$

Binary				decimal	Hexa- decimal
D	C	B	A		
0	0	0	0	0	0
0	0	0	1	1	1
0	0	1	0	2	2
0	0	1	1	3	3
0	1	0	0	4	4
0	1	0	1	5	5
0	1	1	0	6	6
0	1	1	1	7	7
1	0	0	0	8	8
1	0	0	1	9	9
1	0	1	0	10	A
1	0	1	1	11	B
1	1	0	0	12	C
1	1	0	1	13	D
1	1	1	0	14	E
1	1	1	1	15	F

$B6_{16} = 11_{10} \times 16_{10} + 6_{10} = 182_{10}$

Calculator

- Windows 7 calculator in programmer mode

The screenshot shows the Windows 7 calculator in programmer mode. The display shows 'B6'. Below the display is a memory dump with columns of hex values: 0000, 0000, 0000, 0000, 0000, 0000, 0000, 0000. Below the memory dump are various calculator functions and a numeric keypad. The 'Hex' radio button is selected.

ascom

Translating hex to binary

Binary				decimal	Hexa-decimal
D	C	B	A		
0	0	0	0	0	0
0	0	0	1	1	1
0	0	1	0	2	2
0	0	1	1	3	3
0	1	0	0	4	4
0	1	0	1	5	5
0	1	1	0	6	6
0	1	1	1	7	7
1	0	0	0	8	8
1	0	0	1	9	9
1	0	1	0	10	A
1	0	1	1	11	B
1	1	0	0	12	C
1	1	0	1	13	D
1	1	1	0	14	E
1	1	1	1	15	F

10A7:9CBA76F3

0001 0000 1010 0111 : 1001 1100 1011 1010 0111 0110 1111 0011

The diagram illustrates the conversion of the hex value 10A7:9CBA76F3 to binary. Each hex digit is expanded into its 4-bit binary equivalent. The hex digit 'A' (10) is highlighted in blue in the table, and its binary value '1010' is also highlighted in blue in the final binary string.

Storage capacity

- One Byte is 8 bits
 - For example 10110111_2
- 1 KiloByte (KB) = 1.024 bytes = 2^{10} bytes
- 1 MegaByte (MB) = 1.048.576 bytes = 2^{20} bytes
- 1 GigaByte (GB) = 1.073.741.824 bytes = 2^{30} bytes
- 1 TeraByte (TB) = 1.099.511.627.776 bytes = 2^{40} bytes
- 1 PetaByte (PB) = 1.125.899.906.842.624 = 2^{50} bytes
- 1 exabyte (EB) = 1.152.921.504.606.846.976 bytes
- 1 zetabyte (ZB) = 1.180.591.620.717.411.303.424 bytes ...
- 1 yottabyte (YB) = 1.208.925.819.614.629.174.706.176 ...
-

Serial vs. parallel

- Serial transmission: (One wire)
 - One bit is transferred at a time
 - Examples:
 - Ethernet
 - SATA (harddisk interface)
 - USB
- Parallel transmission: (Multiple wires)
 - Multiple bits are transferred at a time
 - Examples
 - 32 or 64 bit CPU

Transmission speeds

- Measured in bits per second (bps)
- Or Bytes per second (Bps)
 - Note B = Byte and b = bit
 - 10 Mbps = 10 Mega **bits** per sekund
 - 10 mbps = 10 **milli** bits per sekund (slow)
- Ethernet speeds range from
 - 10 Mbps to 100 Gbps

Communications buzzwords

- UNICAST:
 - Communications from One host to One host.
 - Like a telephone conversation
- MULTICAST:
 - Communications from One host to multiple hosts
 - Like a radiostation. One transmitter
- HALF DUPLEX:
 - Communications between two hosts

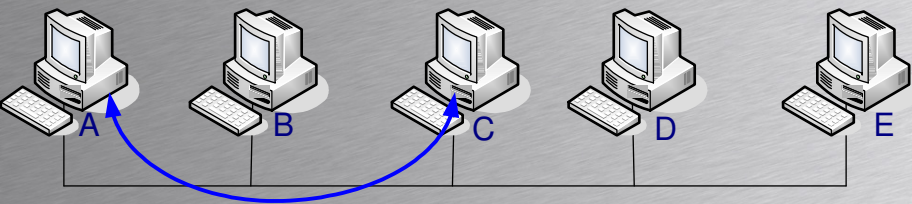

Communications buzzwords

- Unicast
- Multicast
- Broadcast
- Half and full duplex

Unicast

- **Unicast** transmission is the sending of messages to a single network destination identified by a unique address

 **ascom**

HOUSE OF TECHNOLOGY
mercontec

Multicast

- **Multicast** is the sending of a message to a group of destination computers simultaneously in a single transmission from the source

 **ascom**

HOUSE OF TECHNOLOGY
mercontec

Broadcast

- Broadcast is the sending of a message to all computers simultaneously in a single transmission from the source

 **ascom**

HOUSE OF TECHNOLOGY
mercontec

Half duplex

- A *half-duplex* (HDX) system provides communication in both directions but only one direction at a time – (not simultaneously).

 **ascom**

HOUSE OF TECHNOLOGY
mercontec

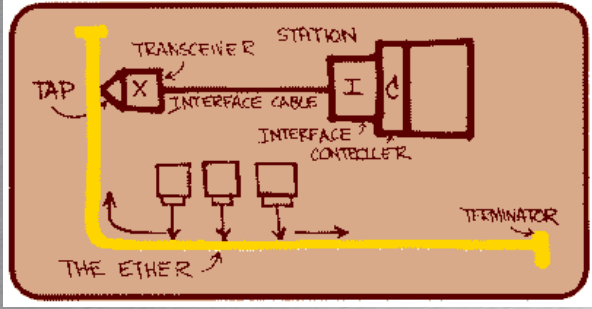

Full duplex

- A *full-duplex* (FDX) allows communication in both directions to happen simultaneously.

ETHERNET

Robert Metcalf's presentation of Ethernet in June 1976.

Ethernet

- Purpose of Ethernet:
 - To exchange digital information between connected stations.
 - Works within limited geographically areas.
 - LAN – Local Area Networks
 - Typically limited to 100 meters in diameter
 - High speed: 10 Mbps to 100 Gbps

Ethernet

- Purpose of Ethernet:
 - To exchange digital information between connected stations.
 - Stations address each other with unique MAC Addresses (Usually written in hexadecimal)
 - E.g. 0010E2F11671 or 00-10-E2-F1-16-71

Command Prompt

```
C:\>ipconfig/all
Ethernet adapter Local Area Connection:

Description . . . . . : Broadcom NetLink (
Physical Address. . . . . : 00-21-86-A0-CE-84
DHCP Enabled. . . . . : Yes
IPv4 Address. . . . . : 192.168.1.14
```

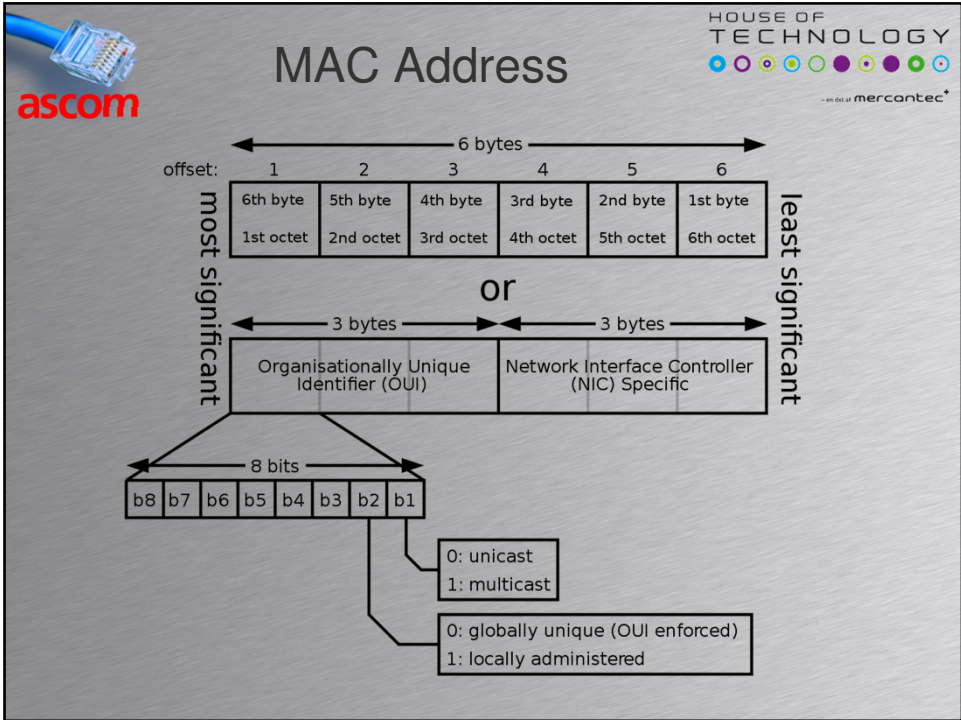

MAC Address

- MAC addresses are administered by IEEE
- MAC addresses are 48 bits wide
 - Example of presentations of same address
 - Windows presentation: 00-10-F4-A3-10-41
 - UNIX/Linux presentation: 00:10:F4:A3:10:41
 - Cisco presentation: 0010.F4A3.1041
- MAC addresses are unique
 - Burned into hardware electronics

S/N: 8K67041190706
 P/N: 080-396-001-R REV: A11
 MAC: (00-80-A3-8C-1B-90)
 Made In: China Date: 0734

IP Version 4

- The IPv4 address consists of 4 bytes (32 bit)
- Decimal dotted notation fx. 194.182.53.13
 - Dots between each 8 bit byte
 - Binary 11000010.10110110.00110101.00001101
- Each byte can be in the range from 0 to 255
 - 255 = 11111111₂

```

cs. Command Prompt
C:\>ipconfig
Ethernet adapter Local Area Connection:
    IPv4 Address. . . . . : 192.168.139.122
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.139.1
  
```

The IP address

- An IP address consists of two parts:
 - A logical network address
 - A host address
- Example: 169.16.32.45
 - Network address (169.16)
 - Host address (32.45)

The subnet mask

- The subnet mask is used to split the IP address into a logical network and host part.
 - 255 indicates part of the network address
 - 0 indicates part of the host address

<input checked="" type="radio"/> Use the following IP address:	
IP address:	172 . 16 . 0 . 100
Subnet mask:	255 . 255 . 0 . 0

- Logical network address: 172.16
- Host address: 0.100

The subnet mask

<input checked="" type="radio"/> Use the following IP address:	
IP address:	10 . 78 . 67 . 100
Subnet mask:	255 . 0 . 0 . 0

- Logical network address: 10
- Host address: 78.67.100

– Or in other words. The host address is 78.67.100 and the host belongs to the logical network address 10

Physical vs. Logical

- A physical network is a number of hosts connected to a shared media where they can communicate with each other based on MAC addresses
 - E.g.
 - Hosts connected via ethernet hubs/switches.
 - Hosts connected to a wireless WiFi network
- A logical network is the network part of an IP address, as specified by the subnet mask.

IP connectivity

- All the hosts below can communicate with each other via IP packets because:
 - All hosts are on the same physical network
 - All hosts belong to the same logical network

IP: 194.182.53.10
Subnet: 255.255.255.0

A

IP: 194.182.53.11
Subnet: 255.255.255.0

B

IP: 194.182.53.12
Subnet: 255.255.255.0

C

IP: 194.182.53.13
Subnet: 255.255.255.0

D

(All four computers are connected to a common physical network backbone.)

IP connectivity

- Host B in the drawing below has no IP connectivity with the other hosts below.
 - All hosts are on the same physical network - but Host B belongs to another logical network.

IP: 194.182.53.10
Subnet: 255.255.255.0

IP: 194.182.52.11
Subnet: 255.255.255.0

IP: 194.182.53.12
Subnet: 255.255.255.0

IP: 194.182.53.13
Subnet: 255.255.255.0

No router present to route packets between logical networks

The ping command

- Built in test function in IP
- Send IP test packet(s) to receiver
 - Commonly known as a ping packet
 - In technical terms called a echo request packet
- Receiver responds test packets
 - In daily terms called a pong packet
 - In technical terms called a echo reply packet
- Notice:
 - Firewalls often block ping packets.

The ping command

```

C:\temp>ping 194.182.53.10

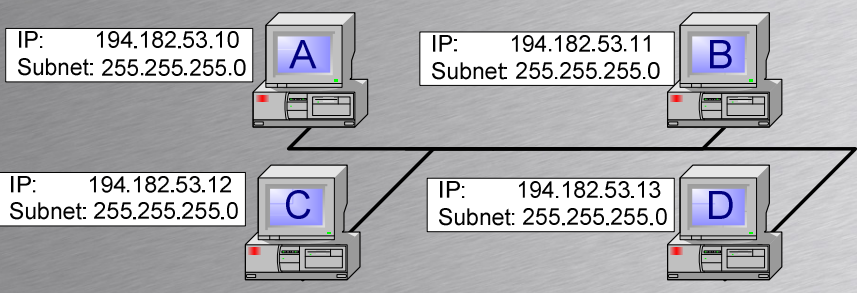

Pinging 194.182.53.10 with 32 bytes of data:
Reply from 194.182.53.10: bytes=32 time<1ms TTL=128
Reply from 194.182.53.10: bytes=32 time<1ms TTL=128
Reply from 194.182.53.10: bytes=32 time<1ms TTL=128
Reply from 194.182.53.10: bytes=32 time<1ms TTL=128

Ping statistics for 194.182.53.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
  
```

Network drawings

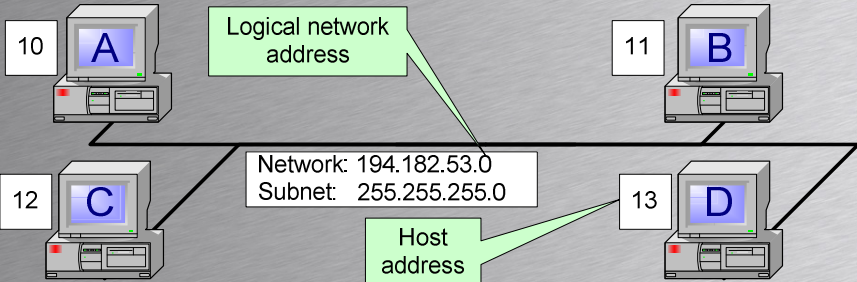

- The drawing below has a lot of numbers
- Hosts are on same physical network and must be on same logical network in order to communicate

Logical network

- Gathering the information.
- All hosts on the physical network belong to the same logical network.
 - Easier to understand and change

The "easy" way

- The subnet mask is four bytes or 32 bits
 - For example 255.255.255.0
 - In binary 11111111.11111111.11111111.00000000
 - The first 24 bits are all ones

Net: 194.182.53.0
 Subnet: 255.255.255.0

=

194.182.53/24

- This notation technique is called the prefix method

ascom

HOUSE OF TECHNOLOGY
mercontec

Prefix notation

- Gathering the information.
- All hosts on the physical network belong to the same logical network.
 - Easier to understand and change

Logical network including prefix /24 = 255.255.255.0

Network: 194.182.53.0/24

Host address

ascom

HOUSE OF TECHNOLOGY
mercontec

Prefix notation - examples

Logical network including prefix /16 = 255.255.0.0

Network: 172.16.0.0/16

Host address

Logical network including prefix /8 = 255.0.0.0

Network: 10.0.0.0/8

Host address

IP address classes

- Originally the IP address was divided in three unicast areas called Classes.
 - **Class A:** Huge networks
 - 16,7 million IP addresses
 - **Class B:** Big networks
 - 65536 IP addresses
 - **Class C:** Small networks
 - 256 IP addresses

IP address classes

- The value of the first byte indicates which class the IP address belongs to.
 - **Class A:**
 - The first byte is between 0 and 127
 - For example 13.56.89.225
 - **Class B:**
 - The first byte is between 128 and 191
 - For example 182.56.89.225
 - **Class C:**
 - The first byte is between 192 and 223
 - For example 201.56.89.225

Class examples

IP address 13.2.3.4

Class A address
13 is between 0 and 127

og

Class C address
194 is between 192 and 223

194.182.53.13

Subnet masks and classes

- Each class has its own subnet mask
 - **Class A:**
 - Subnet mask 255.0.0.0
 - **Class B:**
 - Subnet mask 255.255.0.0
 - **Class C:**
 - Subnet mask 255.255.255.0

IP Classes

Class	Purpose	First byte between	Subnet mask	Prefix	Max hosts
A	Unicast	0 and 127	255.0.0.0	/8	254
B	Unicast	128 and 191	255.255.0.0	/16	65.534
C	Unicast	192 and 223	255.255.255.0	/24	16.777.214

Additional classes

Class	Purpose	First byte between	Subnet mask	Prefix	Max hosts
D	Multicast	224 and 239	None special	None	-
E	Reserved	239 and 255	None	None	-

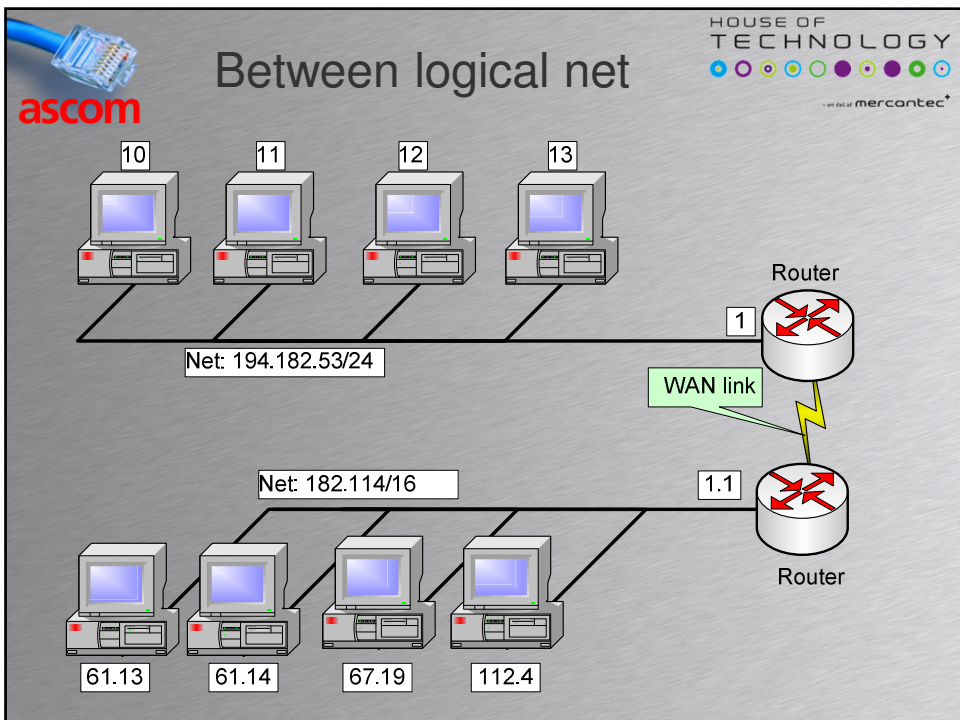

Unicast classes

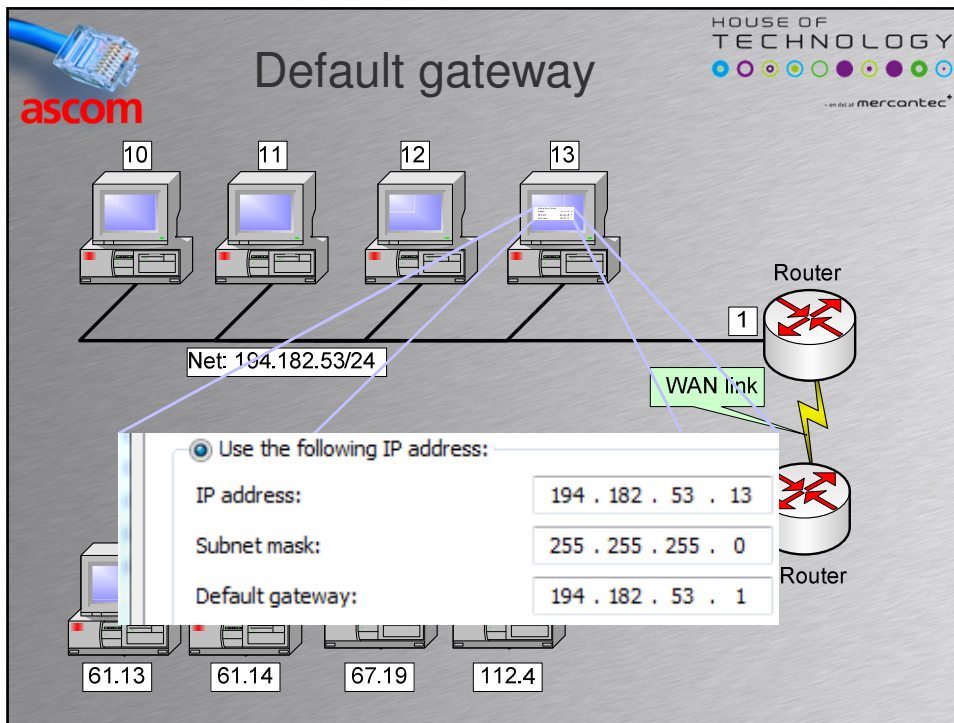

- With the growth of the Internet, it was realized that dividing the IP unicast address space in three classes was inefficient.
- Today IP addresses are classless.
- All IP addresses can use all subnet masks
- The class concept however is still used

ascom

HOUSE OF TECHNOLOGY

 -- est. 06.01 mercontec --

BASIC ROUTING

The route table

- The route table is a list of all known logical networks the hosts know.
- If the hosts don't know a specific logical network, they will use the default gateway – if present.
 - Logical gateway is known as 0.0.0.0/0
 - 0.0.0.0/0 means all networks with all subnet masks

ascom

HOUSE OF TECHNOLOGY

mercontec

ascom

HOUSE OF TECHNOLOGY
mercontec

The route table

```

C:\temp>route print

Network Destination     Netmask          Gateway          Interface
0.0.0.0                 0.0.0.0         194.182.53.1   194.182.53.13
127.0.0.1               255.255.255.255 On-link         127.0.0.1
194.182.53.0           255.255.255.0   On-link         194.182.53.13

```

61.13 61.14 67.19 112.4

ascom

HOUSE OF TECHNOLOGY
mercontec

Understanding the route table

- Each line represents a known logical network

List of known logical networks

The subnet mask of each known logical subnet mask

Command to see the route table

Which interface to send the packets out of

```

C:\temp>route print

Network Destination     Netmask          Gateway          Interface
0.0.0.0                 0.0.0.0         194.182.53.1   194.182.53.13
127.0.0.1               255.255.255.255 On-link         127.0.0.1
194.182.53.0           255.255.255.0   On-link         194.182.53.13

```

The gateway (router) to send the packet to.
If not on-link (Same physical network)

Understanding the route table

```

Command Prompt
C:\temp>route print

```

Network	Destination	Netmask	Gateway	Interface
	0.0.0.0	0.0.0.0	194.182.53.1	194.182.53.13
	127.0.0.1	255.255.255.255	On-link	127.0.0.1
	194.182.53.0	255.255.255.0	On-link	194.182.53.13

- If the host have to send a packet to the destination 194.182.53.67 it will search the route table and find two possible ways to the destination
 - 0.0.0.0/0 via 194.182.53.1 out of interface 194.182.53.13
 - 194.182.53.0/24 on-link out of interface 194.182.53.13
- It will choice the most specific route. The one with the best subnet mask. /24 is better than /0

Understanding the route table

```

Command Prompt
C:\temp>route print

```

Network	Destination	Netmask	Gateway	Interface
	0.0.0.0	0.0.0.0	194.182.53.1	194.182.53.13
	127.0.0.1	255.255.255.255	On-link	127.0.0.1
	194.182.53.0	255.255.255.0	On-link	194.182.53.13

- If the host have to send a packet to the destination 8.8.8.8 it will search the route table and find one possible way to the destination
 - 0.0.0.0/0 via 194.182.53.1 out of interface 194.182.53.13
- The packets to 8.8.8.8 will be send to the default gateway as 8.8.8.8 is on another logical network

IP Summary

- A host can send direct to other host on its own logical network
- To send to hosts on other logical network the host need to know a router.
 - A router is an intermediate device which passes packets on towards its destination.
- 172.16.0.0/16 is a class B net
 - Network: 172.16.0.0
 - Subnet mask: 255.255.0.0

ARP

Address Resolution Protocol

Binding the MAC address and the IP address

Command Prompt

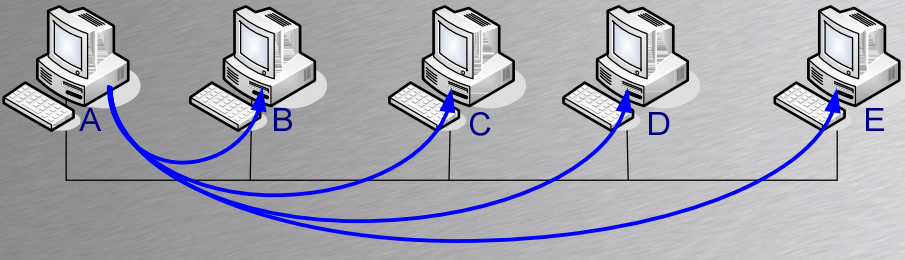

```
C:\temp>arp -a
```

Interface: 194.182.53.13		
Internet Address	Physical Address	Type
194.182.53.1	01-00-5e-7f-ff-fa	dynamic
194.182.53.12	01-00-5e-7f-ff-fd	dynamic
194.182.53.11	00-26-82-ed-47-38	dynamic

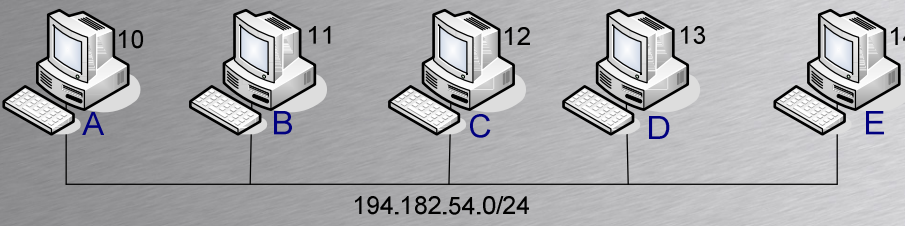

Broadcast

- Ethernet adapters listens for
 - Ethernet frames to its own MAC address
 - Frames to the MAC address FF-FF-FF-FF-FF-FF
- Sending frames to FF-FF-FF-FF-FF will be received by all adapters on the physical network

ARP

- To exchange unicast IP packets between two hosts the transmitting host need to know the MAC address of the receiving host.
- ARP (Address Resolution Protocol) is used to find the MAC address of a given hosts IP address.

194.182.54.0/24

ascom

HOUSE OF TECHNOLOGY
mercontec

ARP

- If host E – 194.182.54.14 – wants to communicate with host B – 194.168.54.11 – it need to know its MAC address first.
- Host E broadcasts on the physical network
 - Who has the IP address 194.182.54.11 ??
 - Host B responds with its MAC address

The diagram shows five desktop computers labeled A, B, C, D, and E, each with a number above it (10, 11, 12, 13, 14 respectively). They are connected to a network labeled 194.182.54.0/24. A blue oval around host E contains the text "Who has 194.18.54.11?". Blue arrows point from this oval to each of the other four hosts (A, B, C, and D), representing a broadcast.

ascom

HOUSE OF TECHNOLOGY
mercontec

ARP

- If host E – 194.182.54.14 – wants to communicate with host B – 194.168.54.11 – it need to know its MAC address first.
- Host E broadcasts on the physical network
 - Who has the IP address 194.182.54.11 ??
 - Host B responds with its MAC address

The diagram shows the same five desktop computers labeled A, B, C, D, and E, each with a number above it (10, 11, 12, 13, 14 respectively). They are connected to a network labeled 194.182.54.0/24. A blue oval around host B contains the text "I am 194.182.54.11 My MAC is 00-26-82-ED-47-38". A blue arrow points from this oval back to host E, representing the response.

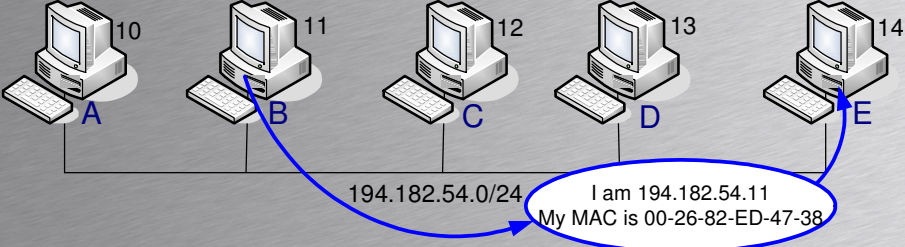

The ARP table

```

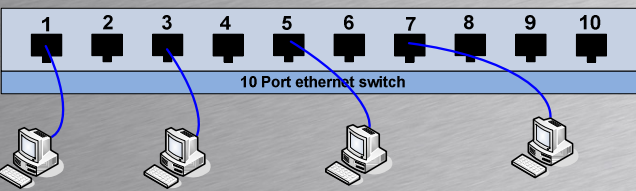

C:\temp>arp -a

Interface: 194.182.53.13
Internet Address      Physical Address      Type
194.182.53.1         01-00-5e-7f-ff-fa    dynamic
194.182.53.12        01-00-5e-7f-ff-fd    dynamic
194.182.53.11        00-26-82-ed-47-38    dynamic
  
```

ETHERNET SWITCHES

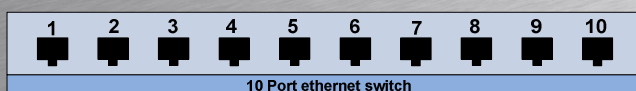

Ethernet switch

- The ethernet switch dynamically learns the connected stations MAC addresses.
 - By looking at the source MAC address in the ethernet frame of transmitted frames

Ethernet II Frame

Destination MAC Adresse	Source MAC Adresse	Type of packet	DATA	FCS Check
6 Bytes	6 Bytes	2 Bytes	46 - 1500 Bytes	4 Bytes

64 to 1518 Bytes

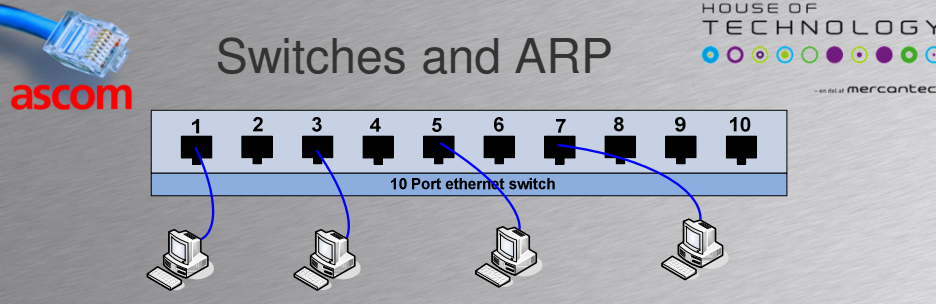

MAC address table

Assuming 10 connected hosts

```

mars.tekkom.dk - PuTTY
Switch# show mac address-table

  Mac Address           Ports
  -----
00-00-74-c2-56-08      Port 1

VLAN's

- Virtual Local Area Networks or VLAN's is splitting a switch in two or more separate sections.
 - One big switch configured as two or more small.

VLAN capable switch

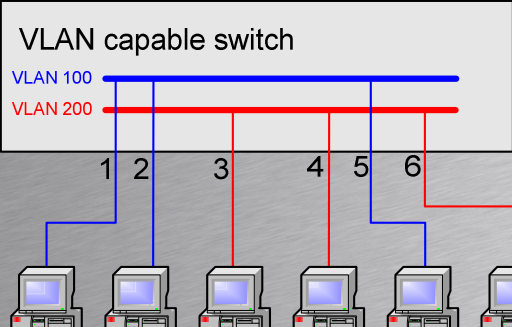

VLAN's

- Each port configured to be in a specific VLAN
 - Port 1,2 and 5 are in VLAN 100
 - Port 3,4 and 6 are in VLAN 200

VLAN capable switch

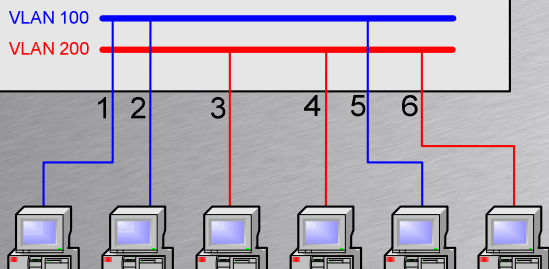

VLAN's

- All stations in VLAN 100 can communicate.
- All stations in VLAN 200 can communicate.
- There is no communication between VLAN 100 and VLAN 200

VLAN capable switch

VLAN 100 —

VLAN 200 —

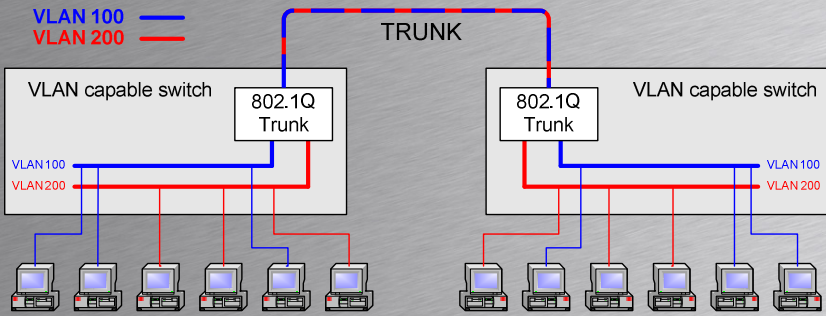

VLAN trunk

- Some switch ports can be configured as trunks
- Trunks carry traffic from one or more VLAN's
 - The two switches in the drawing below are connected with a trunk.

VLAN 100 —

VLAN 200 —

TRUNK

VLAN trunk

- All stations in both VLAN's can communicate
 - The trunk carries VLAN traffic between switches
- There is no communication between VLAN 100 and VLAN 200 in the drawing below.
