

# IP Telephony

HOUSE OF  
TECHNOLOGY

- en del af **mercantec**<sup>+</sup>

## IPT Intro

## Telephony principles and VoIP

# Subjects

- Basic Telephony PSTN/POTS/ISDN.
- ITU E.164 numbering plan.
- Circuit switched vs. packet switched telephony.
- Basic signaling in-band/out-of-band (DTMF/Q.931).
- Codec operation (G.726, G.711, G.722, G723, G.729).
- Wireshark

# BASIC TELEPHONY

- PSTN
- POTS
- ISDN

# PSTN

Public switched telephone network

- PSTN or public switched telephone network
  - Worlds public switched telephone network
  - Connecting phones worldwide
  - Share common international standards (ITU)
    - International Telecommunication Union
  - ITU Telecom (ITU-T) is a subdivision of ITU
  - Share common numbering plan (ITU-T E.164)
    - For example: +45 48198283

# PSTN

Public switched telephone network

- PSTN consists of
  - Telephone lines for fixed phones
  - Cellular networks for mobile phones
  - Fiber optic cables
  - Microwave transmission links
  - Communication satellites
  - Undersea telephone cables
  - Telephone switches (Exchanges)

# POTS

Plain old telephone service

- A part of PSTN
- Connects subscriber to PSTN
- Available since late 19<sup>th</sup> century
  - Graham Bell introduced his telephone in Europe in 1877
- Not much change since 😊

# POTS

Plain old telephone service

- Offer bidirectional analog voice
  - Full duplex communication
- Voice band 300 Hz to 3.400 Hz
  - Human voice in limited frequency range
  - HIFI systems offer 20 Hz to 20.000 Hz
- Call progress
  - Dial tone and ringing signal
- Subscriber dialing
  - Able to dial other subscriber

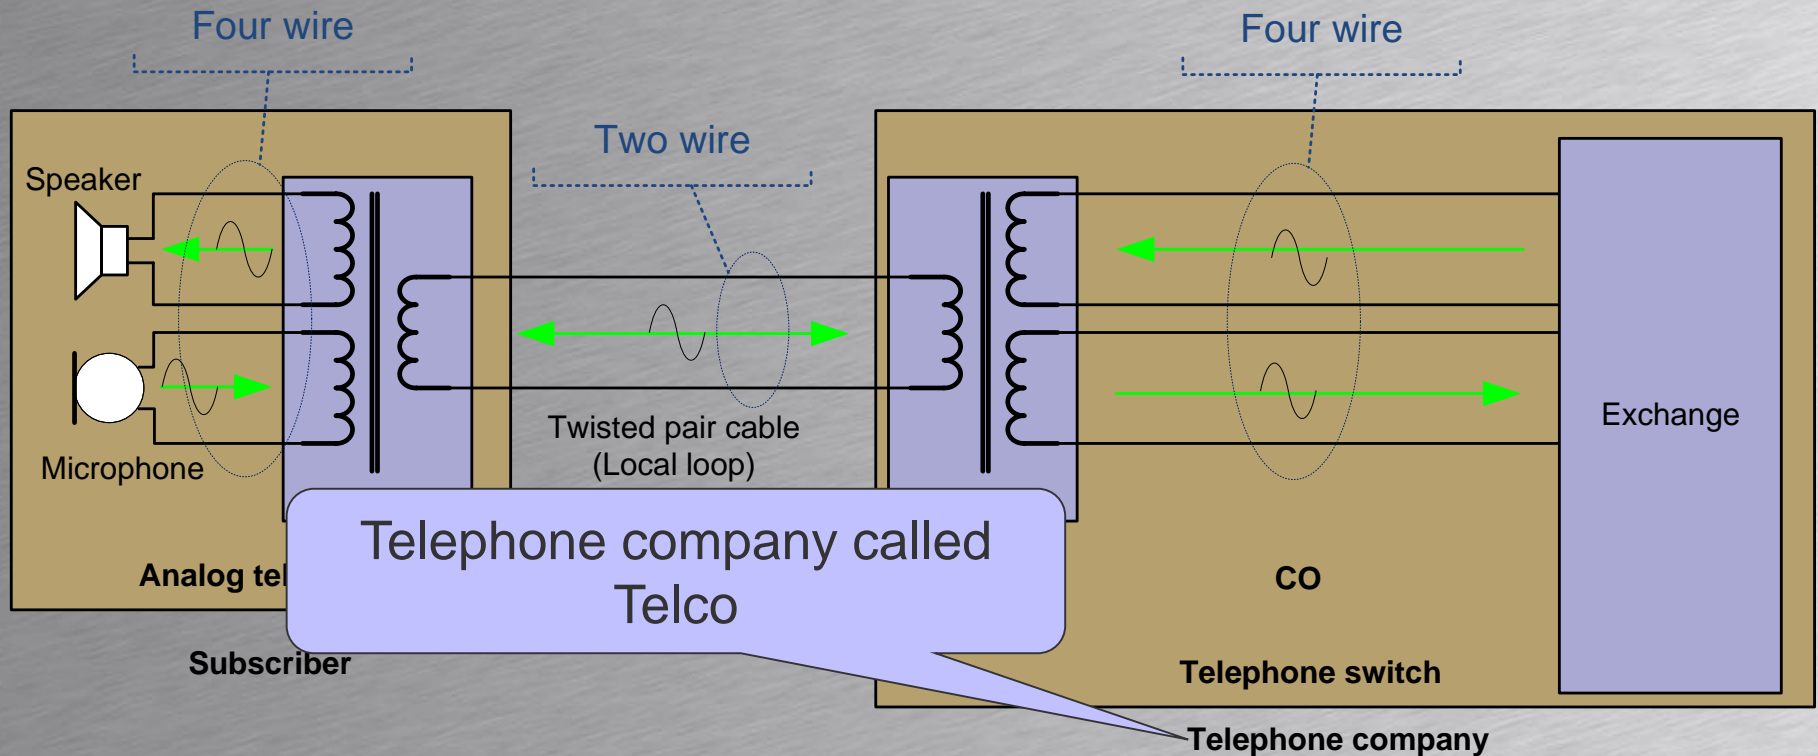

# POTS

Plain old telephone service

- Two wire twisted pair cable between subscriber and CO (Central Office) or telephone company.
  - Also called local loop or the last mile.
  - Bidirectional communication on two wires

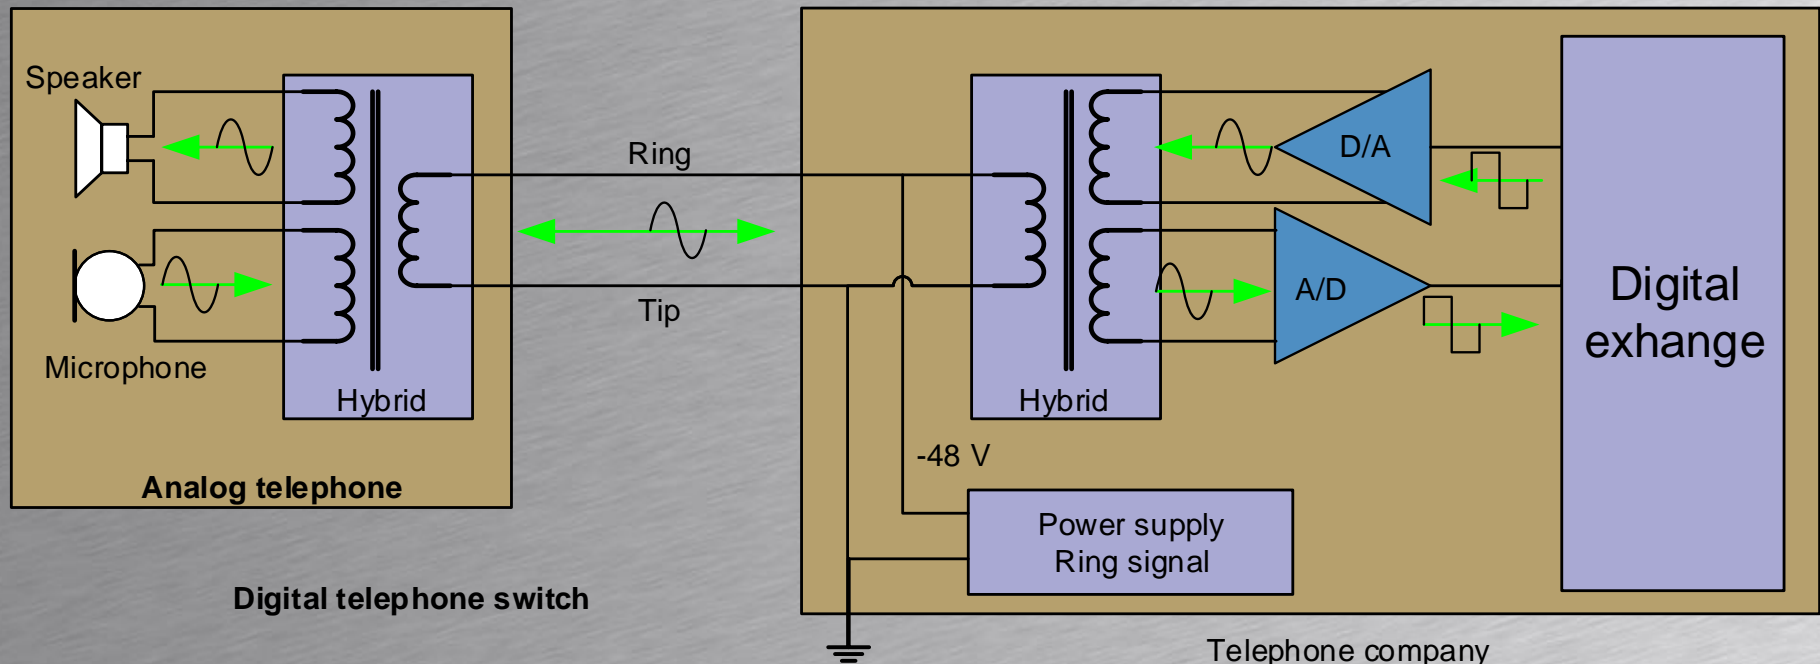

# POTS

Plain old telephone service

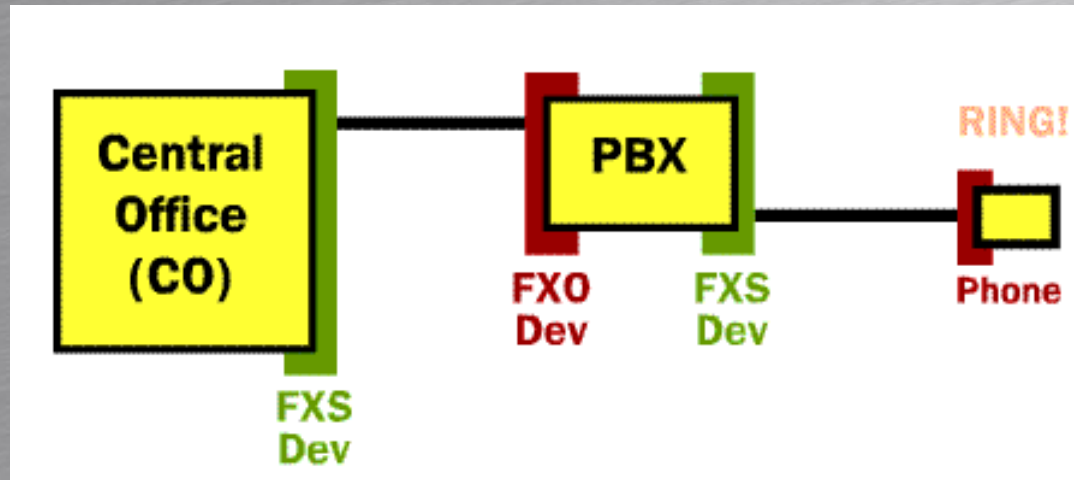

- Power supply to telephone
  - -48 volt DC from exchange to telephone (Tip ground)
  - Often referred to as battery power
- Ring signal from exchange to telephone
  - 90 volt AC at 20 Hz

# FXS and FXO

- FXS or foreign exchange service
  - Telephone interface supplying battery power, dial tone and ringing signal
- FXO or foreign exchange office
  - Telephone interface generating off/on-hook

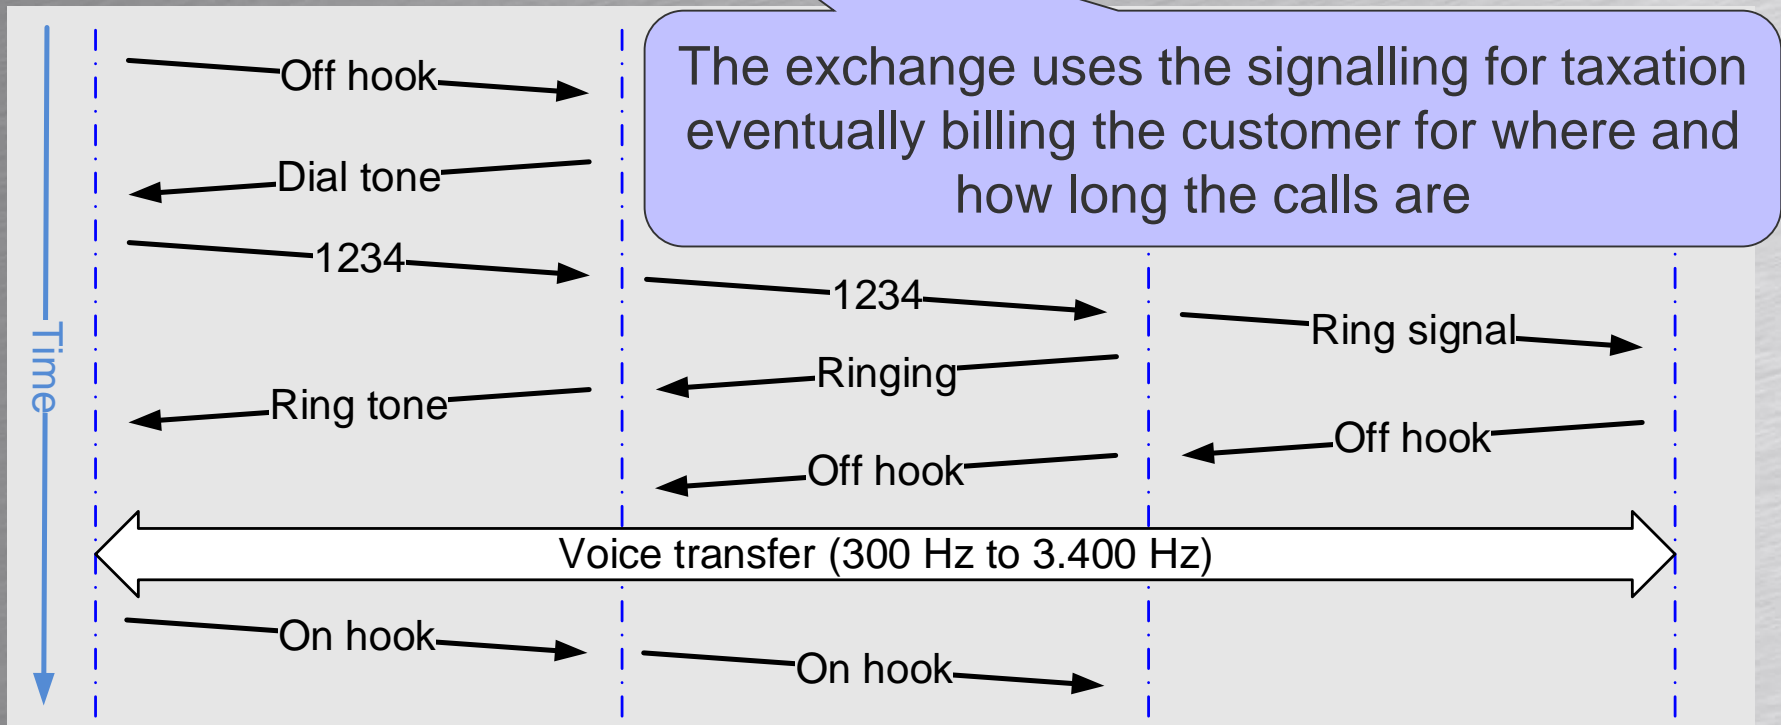

# Signaling and voice

- Two kinds of data transmitted on POTS
  - Analog voice between 300 Hz and 3.400 Hz
  - Signaling – When dialing – for example:
    - Off hook signal from phone to exchange
    - Dial tone from exchange to phone
    - Transfer of dialed number from phone to exchange
    - Ring tone from exchange to phone
    - On hook signal from phone to exchange

# Signaling and voice

## POTS call progress

# POTS signaling

- Transfer of dialed number between phone and exchange
- Two ways of transferring number
  - Pulse (Old way – can still be used on POTS)
  - DTMF

Pulse signaling

DTMF signaling

ascom

# Pulse dialing

- Different standards

- Sweden:

- 1 pulse for 0
    - 2 pulses for 1
    - ...
    - 10 pulses for 9

- World (except Oslo and Australia)

- 1 pulse for 1
    - 2 pulses for 2
    - ...
    - 9 pulses for 9
    - 10 pulses for 0

ascom

# Pulse dialing

- Different standards
  - Oslo and Australia:
    - 1 pulse for 9
    - 2 pulses for 8
    - ...
    - 9 pulses for 1
    - 10 pulses for 0

10 – digit = number of pulses

Oslo and Australia

- Pulses are generated through the making and breaking of the telephone connection

# DTMF Dialing

- Dual Tone Multiple Frequencies
  - Two tones sent simultaneously when button pressed

Frequency	1209 Hz	1336 Hz	1477 Hz	1633 Hz
697 Hz	 1	2	3	A
770 Hz	4	5	6	B
852 Hz	7	8	9	C
941 Hz	*	0	#	D

# DTMF Dialing

- Telephone sends dual tone when keypad pressed
- Exchange recognizes dual tones and interprets them as digits
- All tones are within the 300 to 3.400 Hz band
  - This is called in-band signaling
  - Voice and signaling carried in the same band

Frequency	1209 Hz	1336 Hz	1477 Hz	1633 Hz
697 Hz	1	2	3	A
770 Hz	4	5	6	B
852 Hz	7	8	9	C
941 Hz	*	0	#	D

**ascom**

# Other tones

- Tones from exchange to telephone reports
  - status of line
  - Equipment
  - status off calls

Examples of events	Low frequency	High frequency
Dial tone (Most of Europe)	425 Hz	None
Dial tone (UK and US)	350 Hz	440 Hz
Busy signal (Most of Europe)	425 Hz	None
Busy signal (UK)	400 Hz	None
Busy signal (US)	480 Hz	620 Hz

# Echo

Acoustic feedback. Sound from Speaker sent back through the microphone to remote user as echo

Mismatch impedance in hybrid echos energy back

Mismatch impedance in hybrid echos energy back as echo

... is greater than 25 mS  
... can be very annoying if greater than 250 mS

# Circuit vs. packet switched

- Circuit switched network (PSTN)
  - A logical connection is made between the two endpoints. (Phones)
  - Bandwidth guaranteed ( 64 Kbps for voice)
  - Delay constant
- Packet switched network (IP network)
  - A logical connection use TCP/UDP between the two endpoints. (IP Phones)
  - No bandwidth guarantee
  - Delay not constant

# Circuit switched

PSTN equipment builds connection between phones guaranteeing the necessary bandwidth and giving a constant delay.

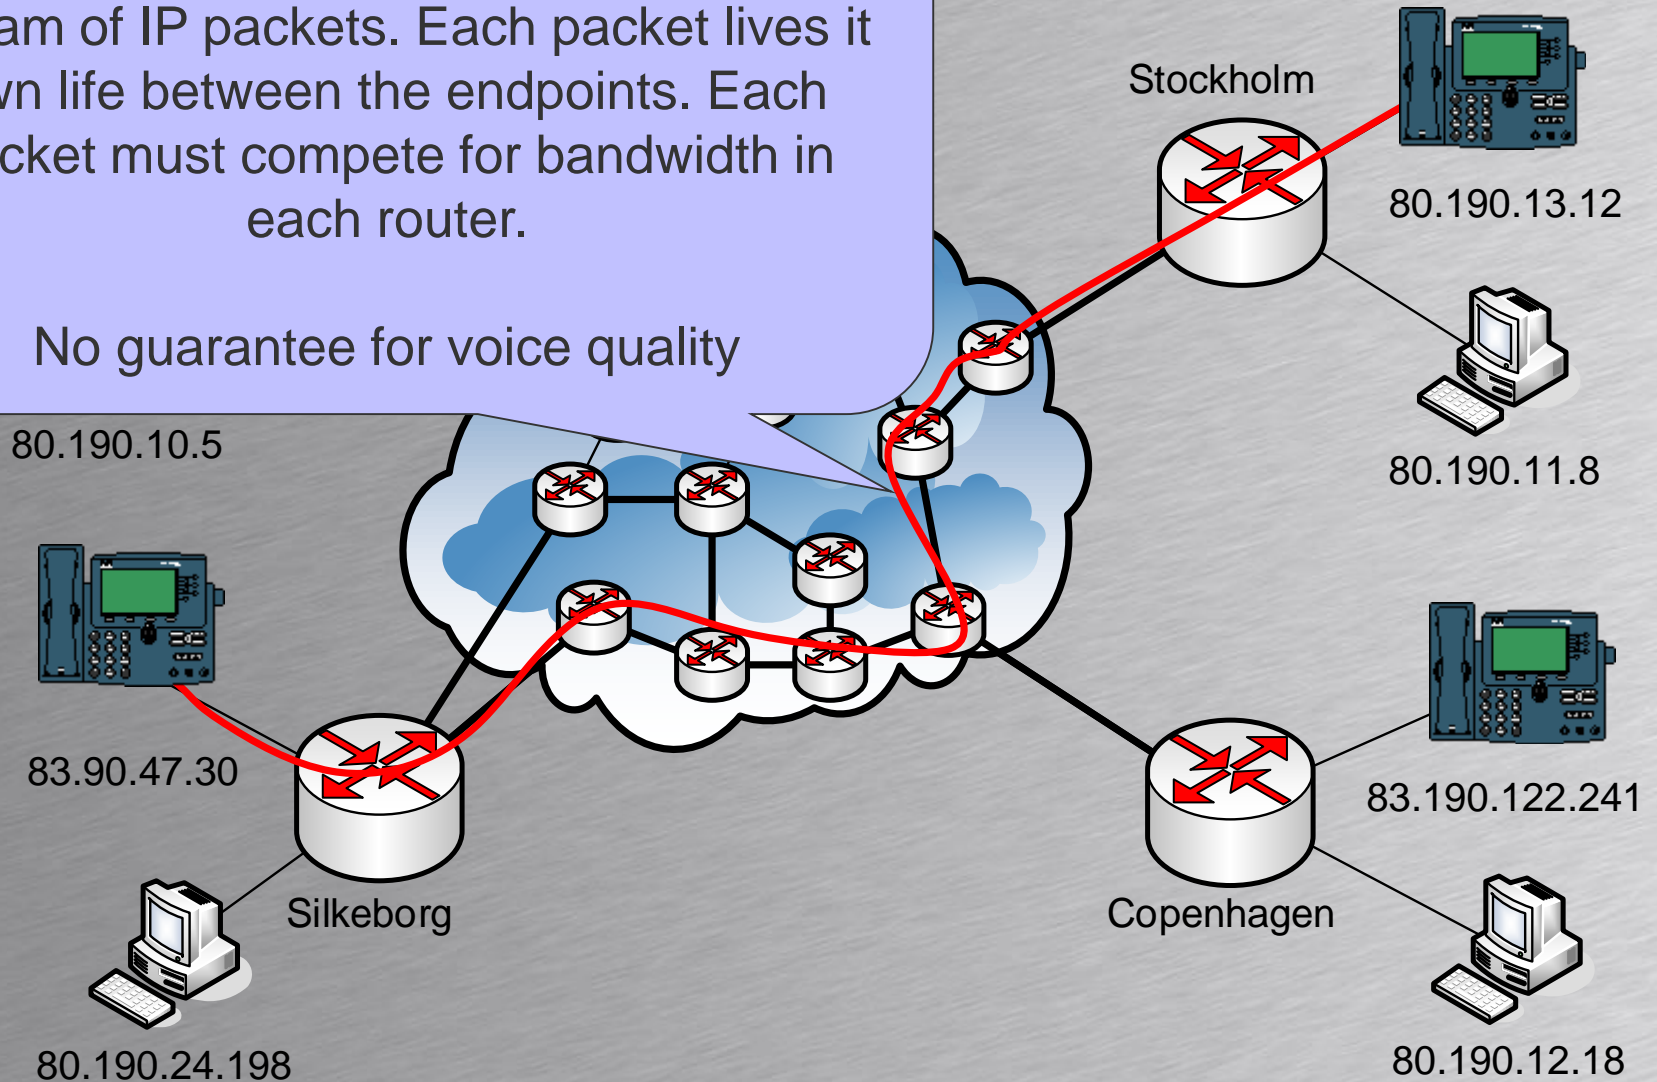

Very good and stable voice quality

# Packet switched

The logical connection consists of a stream of IP packets. Each packet lives its own life between the endpoints. Each packet must compete for bandwidth in each router.

No guarantee for voice quality

# QoS: Quality of Service

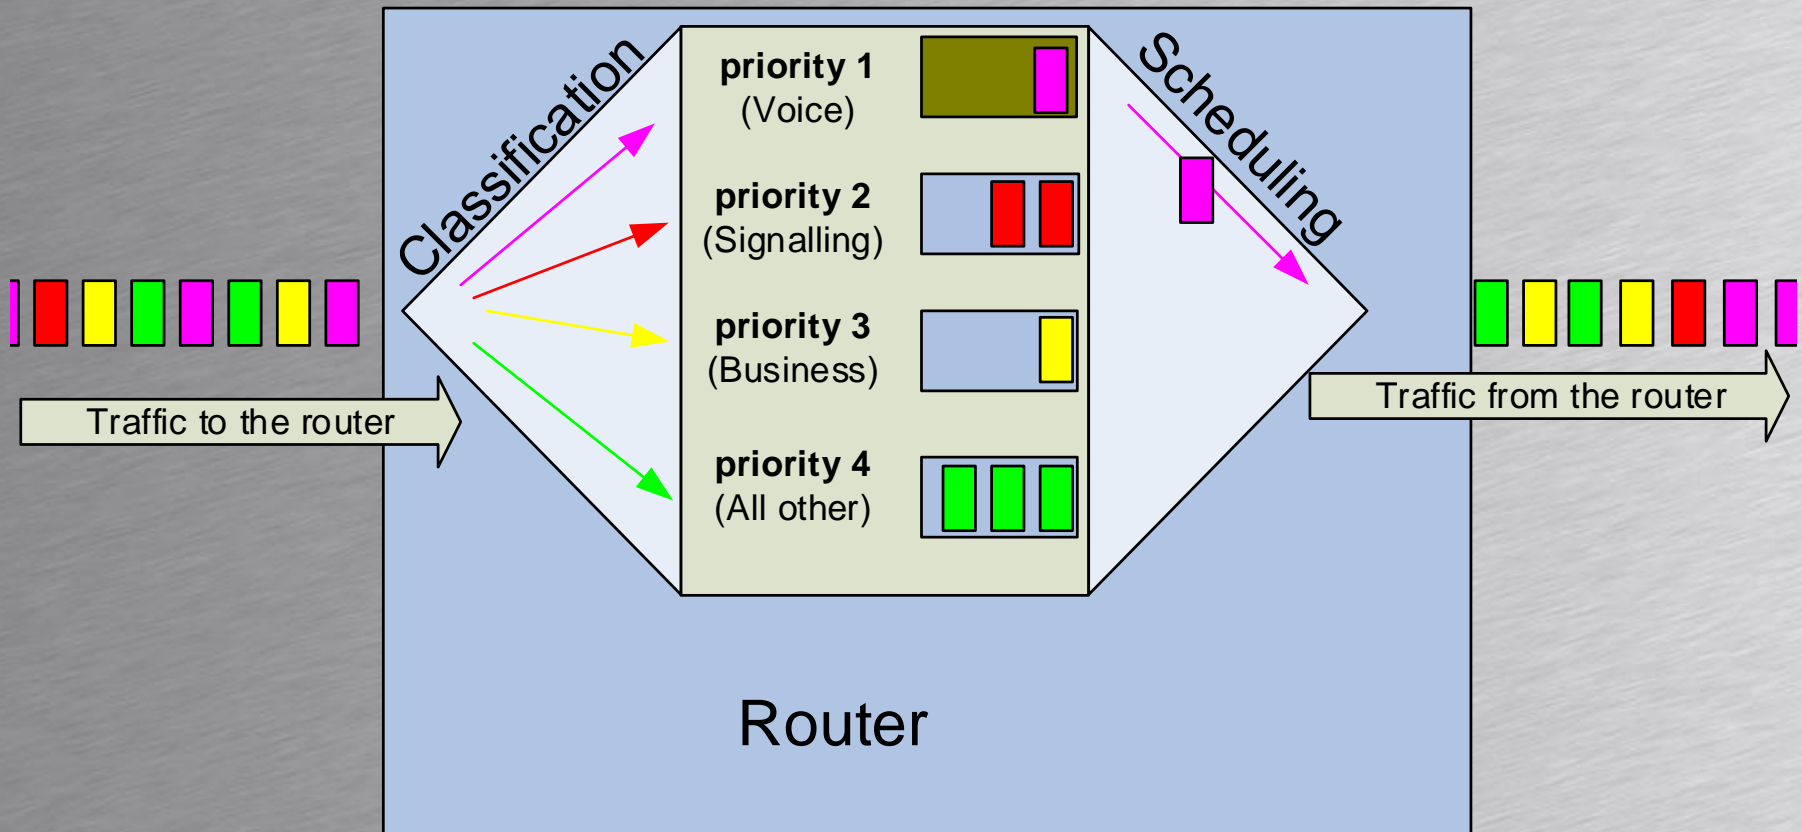

- Used in packet switched networks
- Some packets are prioritized (Voice packets)
- Routers and switches are configured to use QoS and which packets to prioritize
- Widely used by companies using VoIP
- No QoS support on the Internet
  - Variable voice quality (Example Skype)

# QoS principle

- The high priority packets overtake the lower prioritized packets in the queues

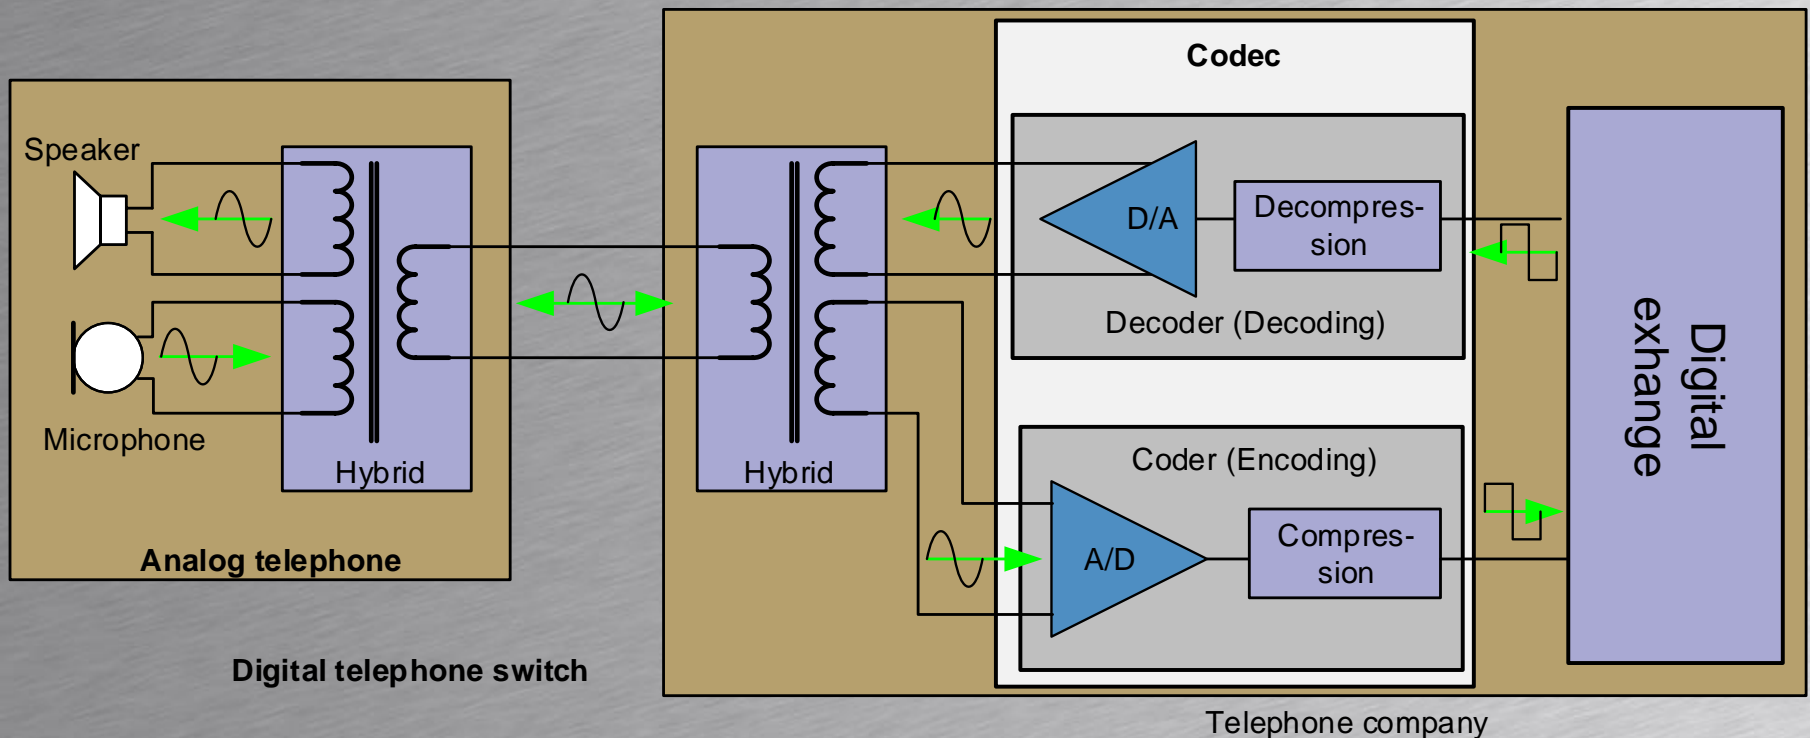

# QoS configured

# Codec coder-decoder

- A coder can encode a signal to a compressed data representation
- Decoding is the reverse of encoding

# Codecs

- Different kinds of audio codecs
  - Many codecs defined and used
  - G.standards developed by ITU-T

Codec	Use	Bandwidth	Data rate	Comment
G.711	Telephony	300-3.400 Hz	64 Kbps	Used on PSTN
G.722	Telephony	50-7.000 Hz	48, 56 or 64 Kbps	
G.723	Telephony	300-3.400 Hz	24 or 40 Kbps	Superceded by G.726
G.726	Telephony	300-3.400 Hz	16, 24 or 32 Kbps	32 Kbps used the most
G.729	Telephony	300-3.400 Hz	8 Kbps	License required
Audio CD	Audio	20-20.000 Hz	1,411 Mbps	HiFi stereo (2 channels)
MP3	Audio	20-20.000Hz	128 to 320 Kbps	Many data rates avail.

# A/D converter

## Analog to Digital converter

- Converts analog input to digital output
  - Digital output is a binary number representing the unknown analog input voltage
- Sample frequency
  - How many samples pr. Second the converter converts the unknown analog signal
- Resolution
  - How many bits the converter converts the unknown analog signal to
    - 4 bits sampling =  $2^4 = 16$  levels
    - 24 bits sampling =  $2^{24} = 16.777.216$  levels

# A/D converter

- X-axis is time
- Y-axis is signal amplitude

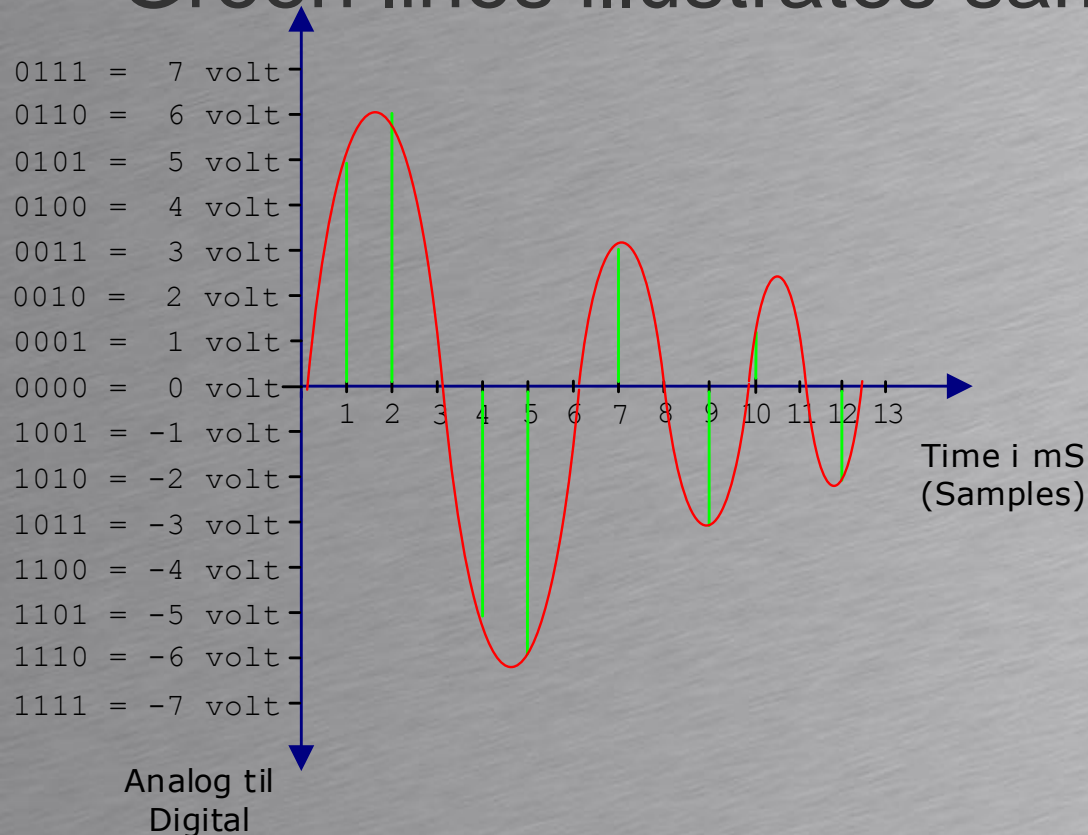

# A/D converter - example

ascom

- Sample rate is 1000 times a second (1 KHz)
- Resolution is 4 bit
- Green lines illustrates samples

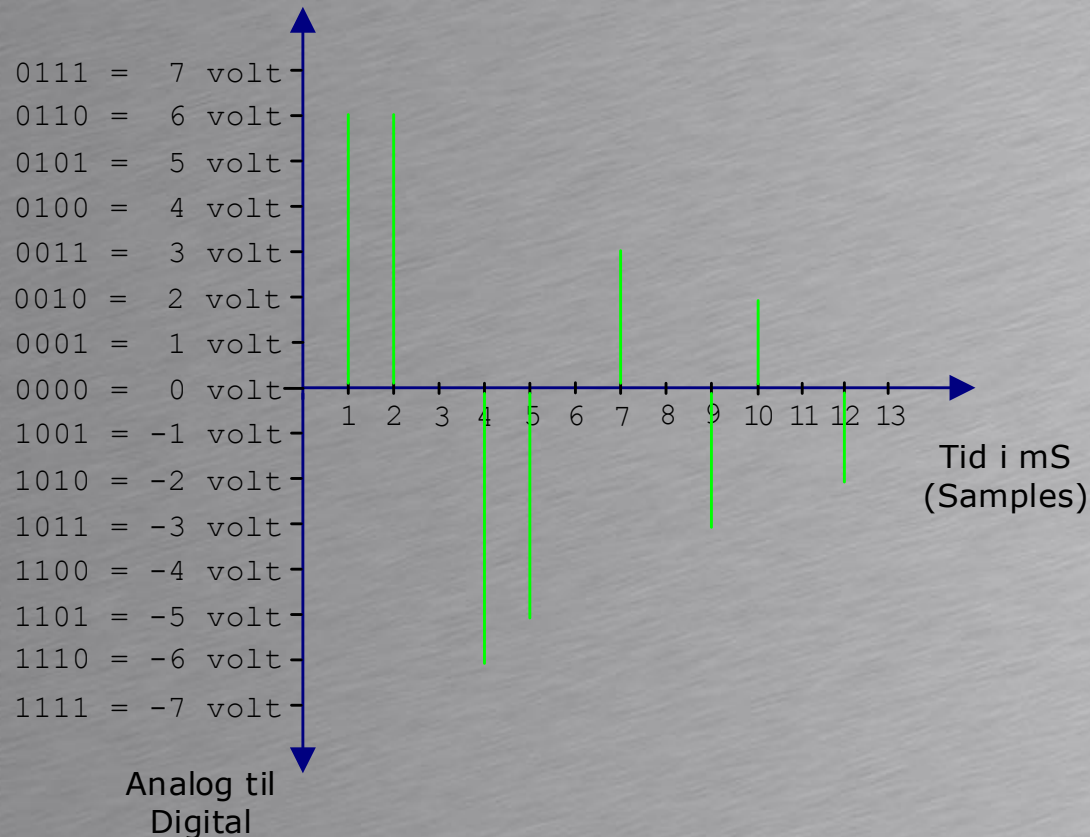

Sample	Value
1	0101
2	0110
3	0000
4	1101
5	1110
6	0000
7	0011
8	0000
9	1011
10	0010
11	0000
12	1010

# D/A converter

- D/A converter receives digital input
- Outputs analog value (Show in green)

Sample	Value
1	0110
2	0110
3	0000
4	1101
5	1110
6	0000
7	0011
8	0000
9	1011
10	0010
11	0000
12	1010
Sample	Value

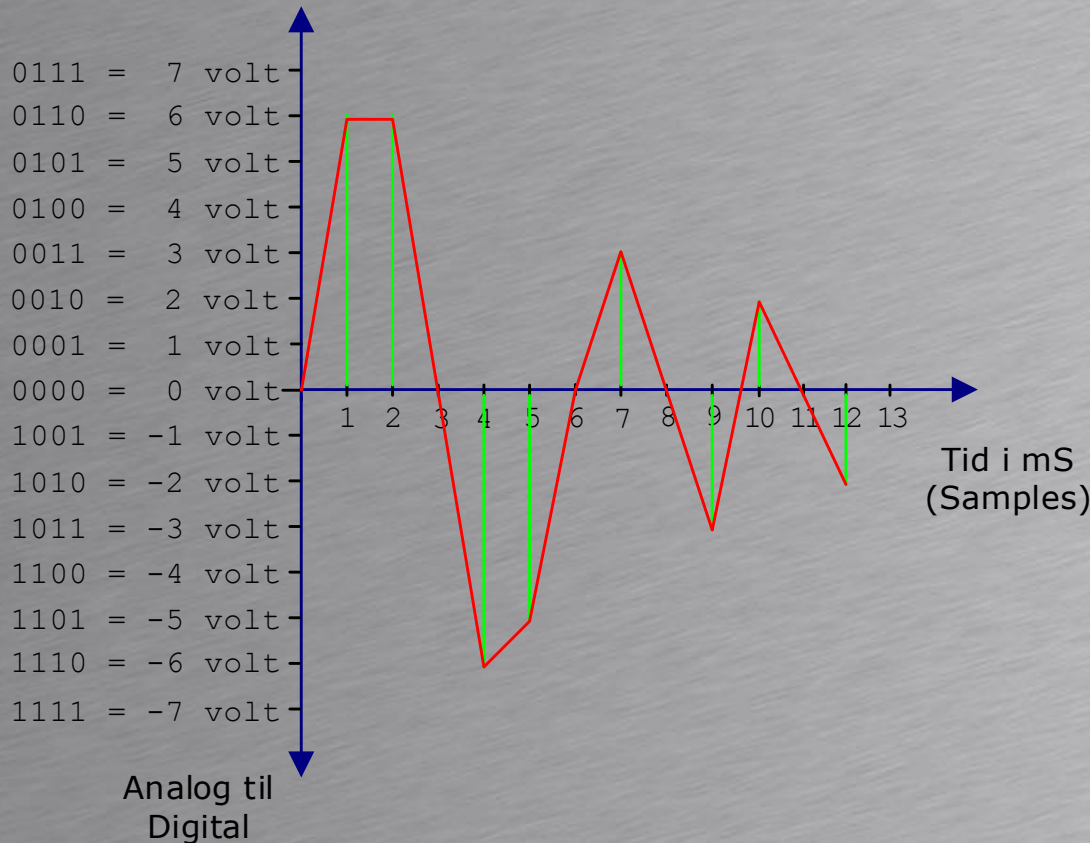

# D/A converter

- Approximated analog waveform at receiver
- Outputs analog value to speaker

ascom

# Nyquist theorem

- Harry Nyquist
  - Swedish scientist working for AT&T
- In 1928 Nyquist stated

To adequately represent an analog wave in digital form , you must sample the analog waveform at a rate at least twice that of the highest frequency to be transmitted

- To transfer voice in the range 300 to 3.400 Hz
  - Sample the signal at least  $2 \times 3.400 = 6.800$  pr. Second
  - To avoid aliasing (distortion) a higher frequency is used

# Codecs

- Common sampling rates

Codec	Use	Bandwidth	Data rate	Sample rate pr. second
G.711	Telephony	300-3.400 Hz	64 Kbps	8.000
G.722	Telephony	50-7.000 Hz	48, 56 or 64 Kbps	16.000
G.723	Telephony	300-3.400 Hz	24 or 40 Kbps	8.000
G.726	Telephony	300-3.400 Hz	16, 24 or 32 Kbps	8.000
G.729	Telephony	300-3.400 Hz	8 Kbps	8.000
Audio CD	Audio	20-20.000 Hz	1,411 Mbps	44.100
MP3	Audio	20-20.000Hz	128 to 320 Kbps	44.100

# MOS

## Mean Opinion Score

- MOS used to validate the quality of telephone voice quality

MOS	Quality	impairment
5	Excellent	Imperceptible
4	Good	Perceptible but not annoying
3	Fair	Slightly annoying
2	Poor	Annoying
1	Bad	Very annoying

Codec	From	Bandwidth	Data rate	MOS
G.711	1972	300-3.400 Hz	64 Kbps	4,1
G.722	1988	50-7.000 Hz	64 Kbps	~4,5
G.726	1990	300-3.400 Hz	32 Kbps	3,85
G.729	1996	300-3.400 Hz	8 Kbps	3,92
GSM EFR	1995	300-3.400 Hz	12,2 Kbps	3,8

# G.711 codecs

- G.711 codecs come in two flavours
  - $\mu$ -Law and A-law

Codec	Used in	Sampling rate	Data rate
$\mu$ -Law	USA and Japan	8 Khz	64 Kbps
A-Law	Europe and rest of the world	8 Khz	64 Kbps

- Data rates for both codes
  - 8000 samples/second x 8 bit/sample = 64 Kbps
- $\mu$ -law and A-law are not compatible

# Codec G.711 A-law

- From analog audio signal to coded bit stream
  - Advanced mathematics used in encoding to preserve voice quality

Stage	Signal	Comment
Filtering	Analog	Input from microphone. High bandwidth
Sampling	Analog filtered	8000 samples of input signal caught pr. Second
Quantizing	Analog samples	Analog to digital conversion. 13 bit precision
Encoding	Compression	8000 compressions second to 8 bit = 64.000 bps

# G.711 codecs

- G.711 codecs come in two flavours
  - $\mu$ -Law and A-law

Codec	Used in	Sampling	Resolution	Compression	Data rate
$\mu$ -Law	USA and Japan	8 Khz	14 bit	to 8 bit/sample	64 Kbps
A-Law	Rest of the world	8 Khz	13 bit	to 8 bit/sample	64 Kbps

- Data rates for both codes
  - 8000 samples/second x 8 bit/sample = 64 Kbps
- $\mu$ -law and A-law are not compatible

# ISDN

Integrated Services Digital Network

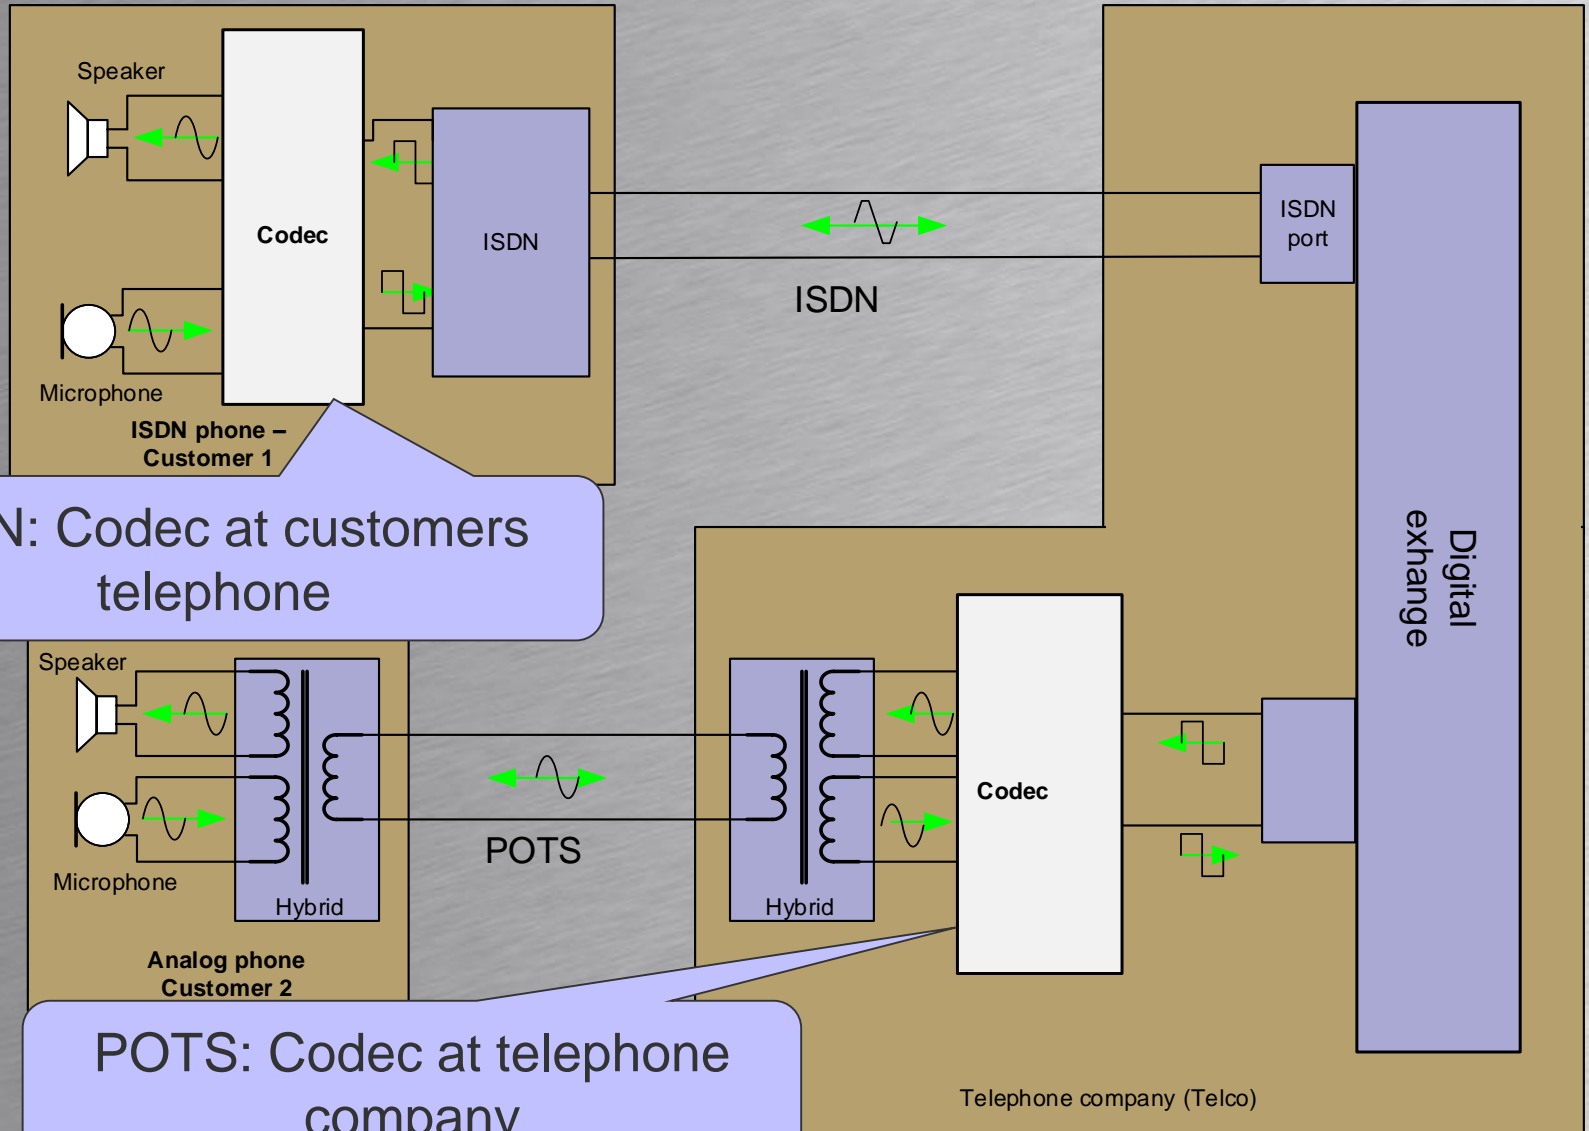

# ISDN

Integrated Services Digital Network

- Defined in 1988
- Communication standards for
  - Carrying voice, video and data over PSTN
  - Digital transmission from end-points (Customer)
  - 64 Kbps channels for voice, data or video
    - called B-channels
  - 16 or 64 Kbps signaling channel or data
    - Called D-channel
  - Both B and D channels are full duplex
    - Simultaneous transmission in both directions

# ISDN phone principle

# ISDN

Integrated Services Digital Network

- Two rates available from providers
- ISDN BRI (Basic Rate Interface)
  - Two 64 Kbps B-channels for voice/data
  - One 16 Kbps D-channel for signaling
  - ISDN BRI
- ISDN PRI (Primary Rate Interface)
  - 23 x 64 Kbps B-channels (USA and Japan)
  - 30 x 64 Kbps B-channels (Rest of the world)
  - One 64 Kbps D-channel for signaling

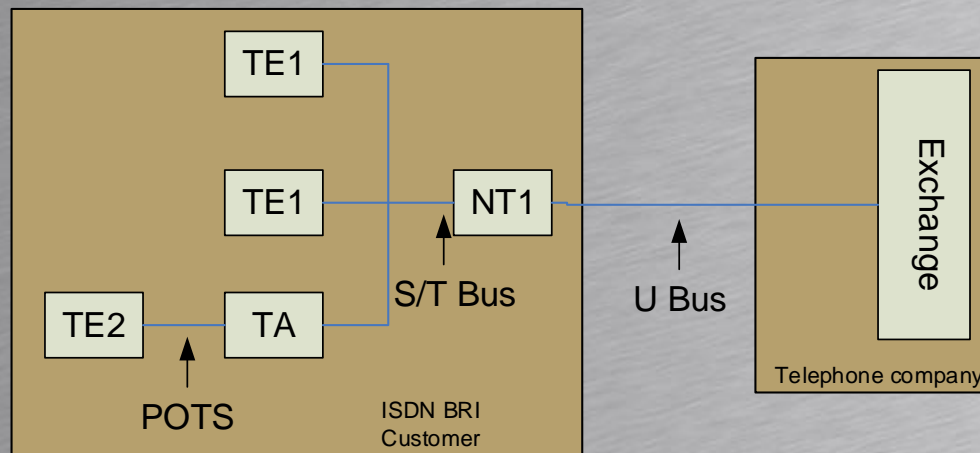

ascom

# ISDN BRI

## Basic Rate Interface

- U bus: Two wire local loop connection
  - Same cable used for POTS
- S/T bus: 2 pairs of wire including power
- NT1 – Network Terminator 1 – small box
- TE1 – Terminal Equipment (ISDN phone)
- TA – Terminal adapter. Converts ISDN to POTS
  - Also called AB ports .Analog to B-channel

# ISDN BRI NT1 box

- NT1 box

Connection to telco  
One pair of wire

Mains power

Connection to ISDN equipment

Connection to analog (POTS)  
equipment

# ISDN PRI

- Mainly used to connect Private telephone exchanges or IP phone system to PSTN
  - Called PBX (Private Branch eXchange)
- For example dial 0 to get a public line
- Customer calls are routed through ISDN PRI

# ISDN PRI

- Different Telco's ISDN products

ISDN standard	Sweden (Telia)	Norway (Telenor)	Denmark (TDC)
ISDN PRI	ISDN Multi	ISDN Proof/FlexiUT	ISDN Flex

Product	Active B channels
Telia ISDN Multi	30
Telenor Proof	2 – 10
Telenor FlexiUT	12 – 30
TDC Flex	8 – 30

# PBX with ISDN PRI

ISDN PRI to telco  
E1 – European ISDN PRI – 2,048 Mbps  
T1 – USA/Japan ISDN PRI – 1,544 Mbps

Connection to local analog phones

# Q.931

- ISDN signalling protocol
- Used to establish, maintain and release connections between end-points. (Phones)
- Signalling carried in ISDN D channel
  - 16 Kbps ISDN BRI
  - 64 Kbps ISDN PRI

# Q.931 signalling

# in/out of band signalling

- ISDN signalling
  - Signalling carried in the D channel
  - Voice/data carried in B-channel
  - Signal and voice separated in two channels or bands
  - ISDN is an example of out-of-band signalling
- POTS
  - Voice carried in the 300 – 3.400 Hz band
  - Signalling – DTMF – carried in the same band
  - POTS is an example of in-band-signalling

# ITU E.164

- International dialing
  - +45 30539361 means
    - + = International call
    - 45 = Country Code (Denmark)
    - 30539361 = national number = NDC+SN
- International calls +
  - From Europe dial 00 + CC + NDC + SN
  - From USA dial 011 + CC + NDC + SN
  - From Japan dial 010 + CC + NDC + SN
  - Exceptions

# ITU-T number plan E.164

## Examples

Country	Number	Country code	NDC (Area Code)	Subscriber number
USA (Texas)	+1-214-555-8283	1	214	5558283
Japan (Tokyo)	+81-3-5618-9876	81	3	56189876
Sweden (STH)	+46-08-685-9000	46	08	6859000
Norway	+47-2324-1245	47		23241245
Denmark	+45-3053-9361	45		30539361
Greenland	+299-981173	299		981173

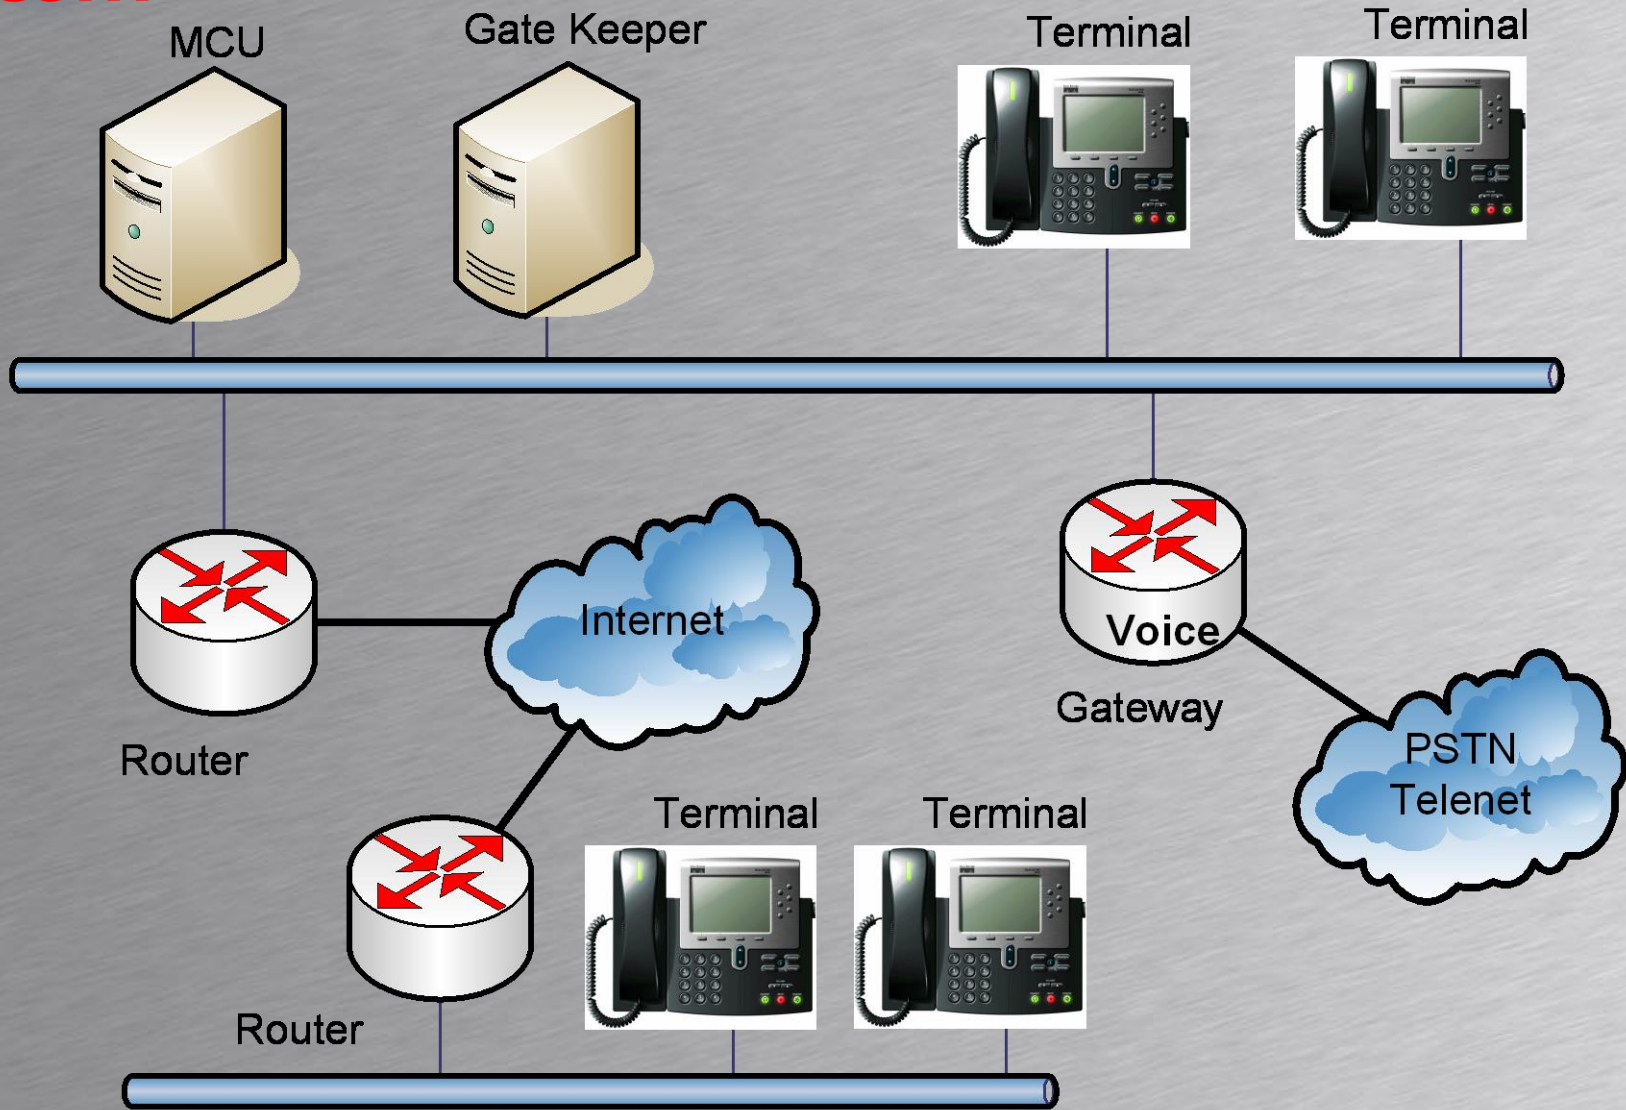

# Task

- Groups of 3
  - Connect 2 phones(7940) to the network
  - Change the number from auto to a fixed number on the CallManager.
    - 10 Group 1
    - 11 Group 2
    - 20 Group 3
    - Etc...
  - Create a personal user for the phone.

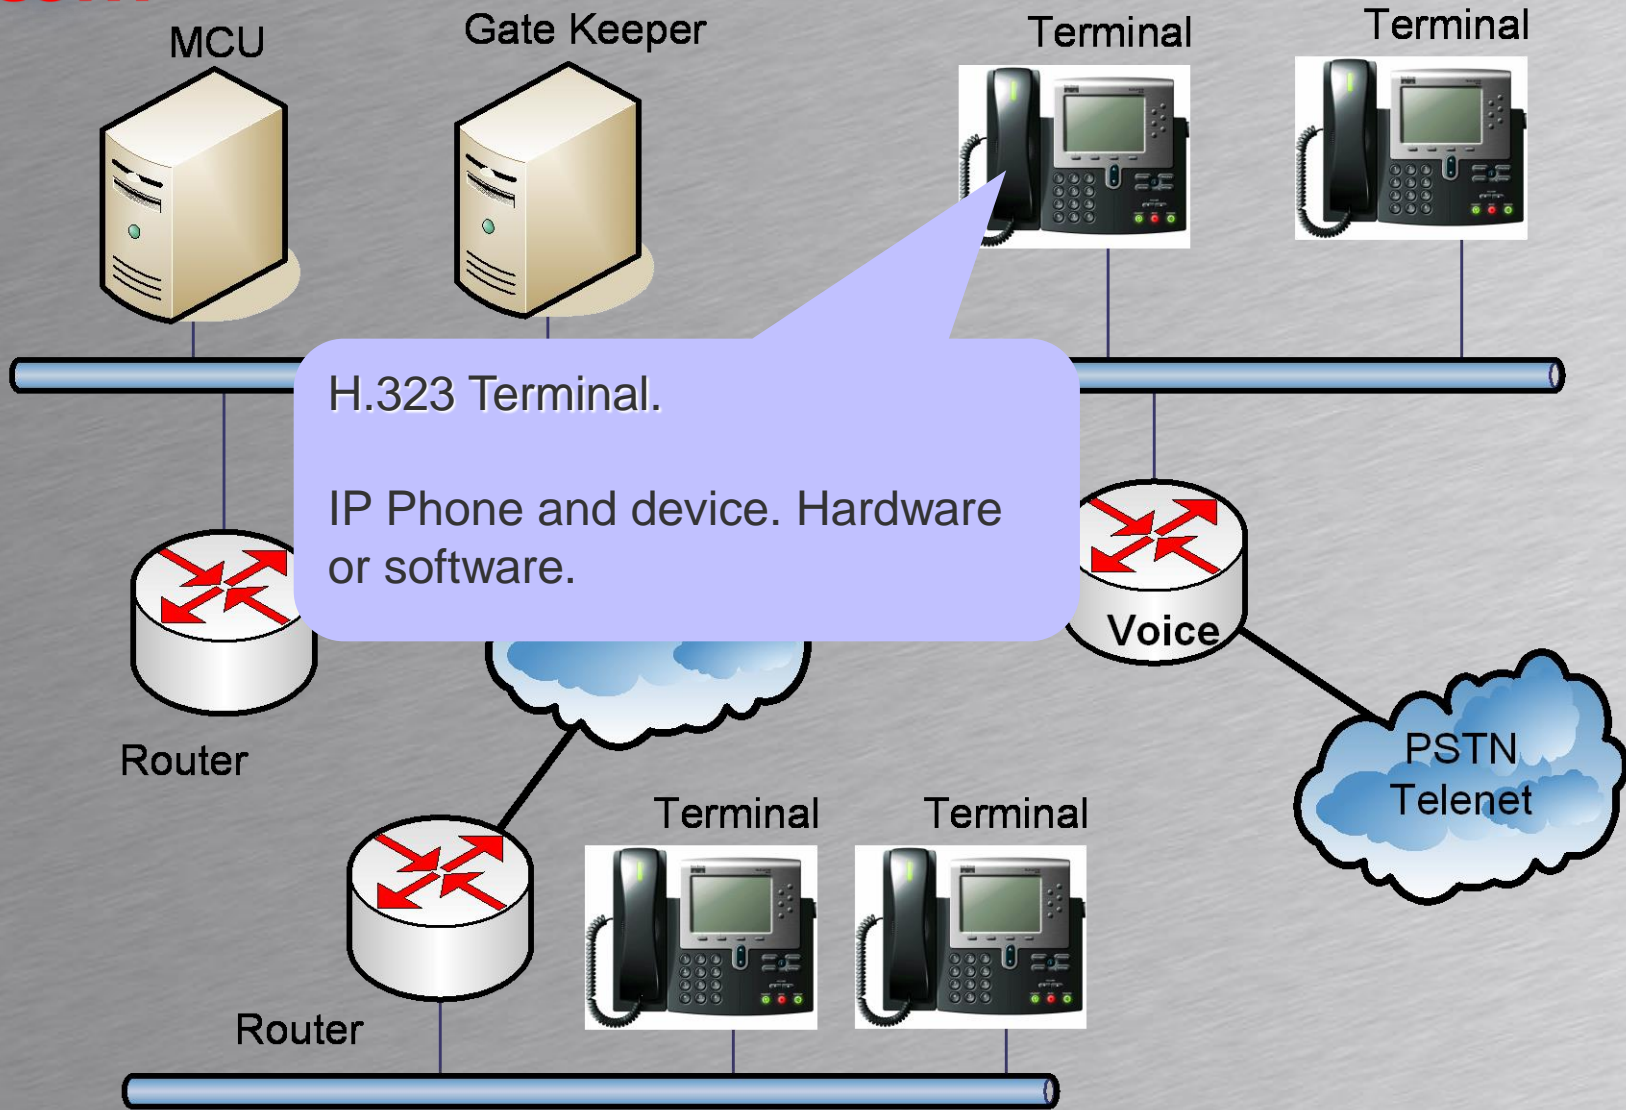

# H.323

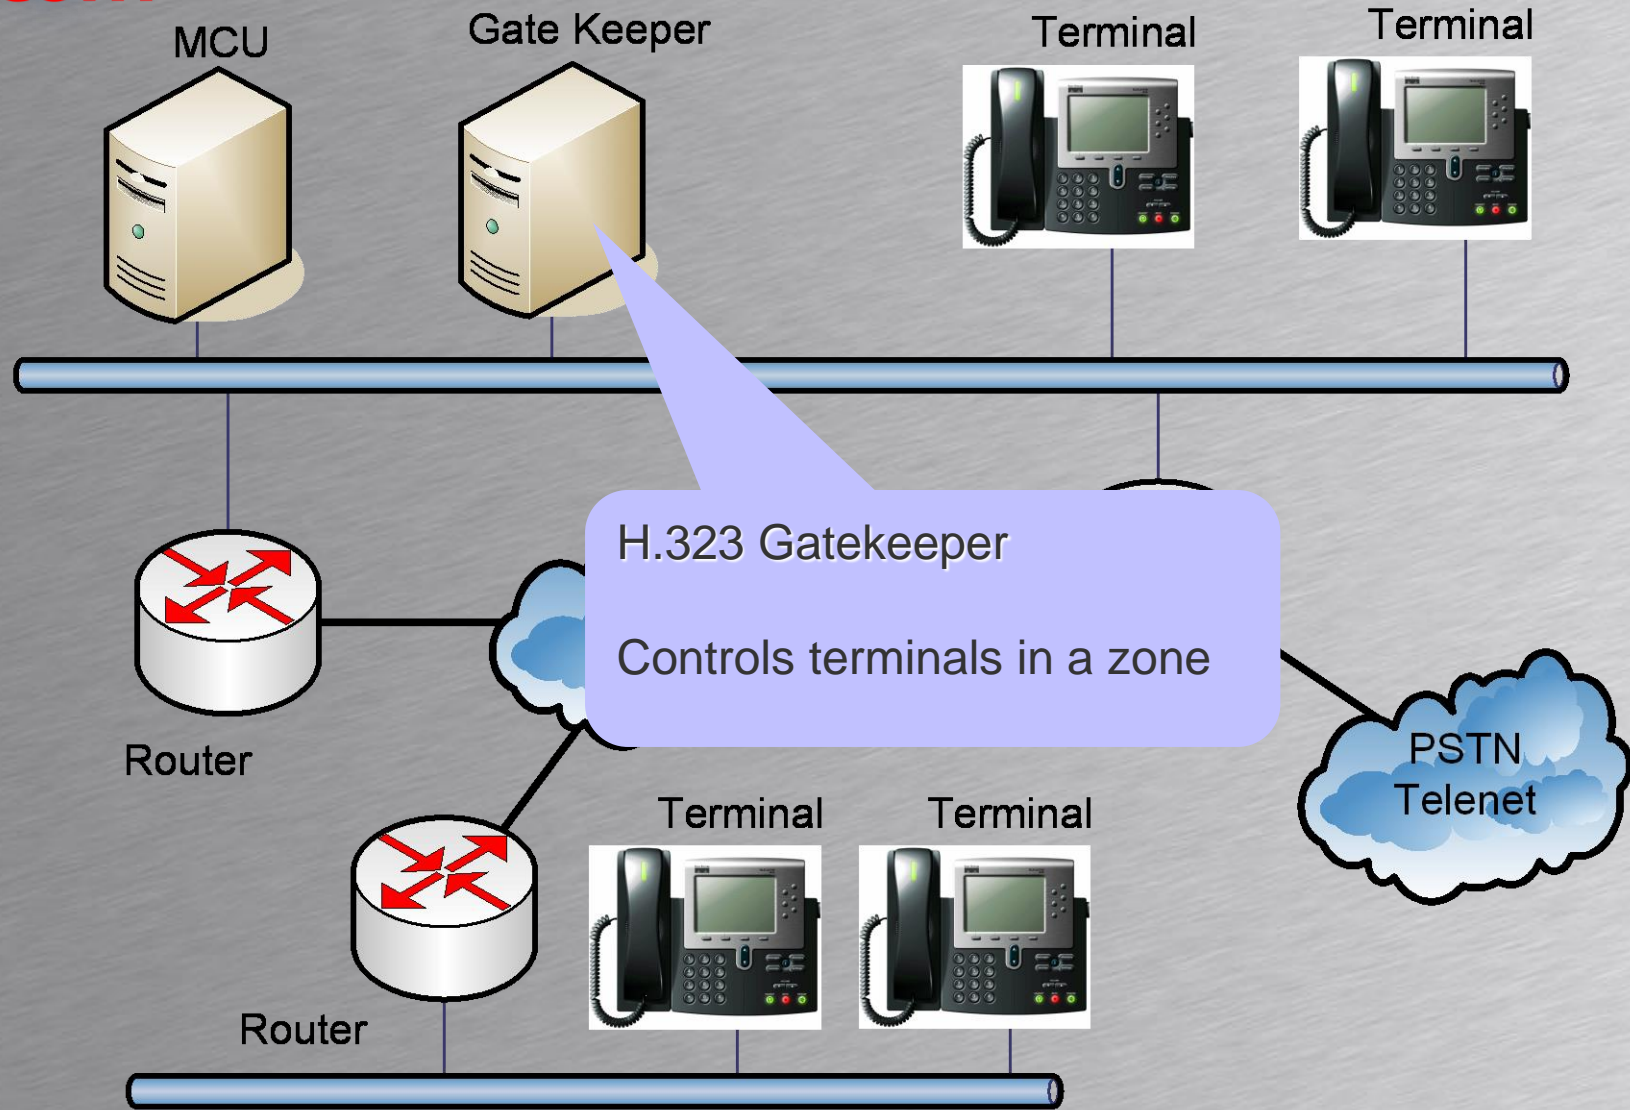

# H.323:Terminal

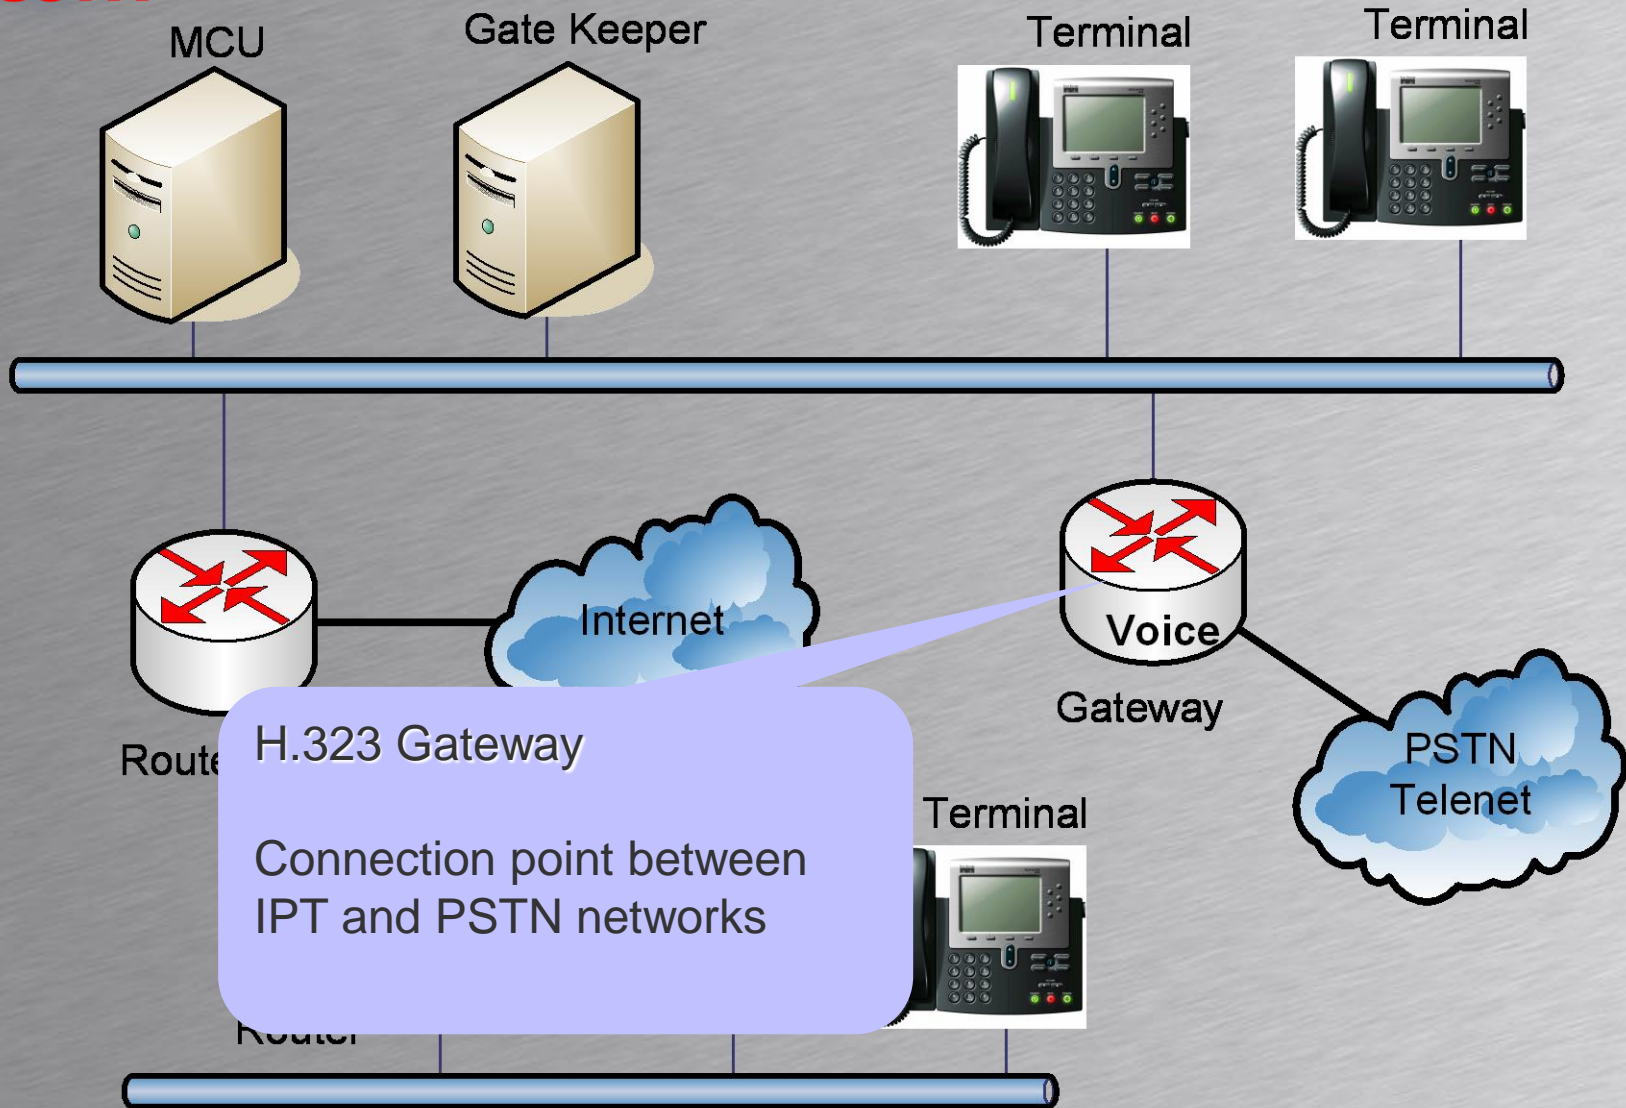

# H.323: Gatekeeper

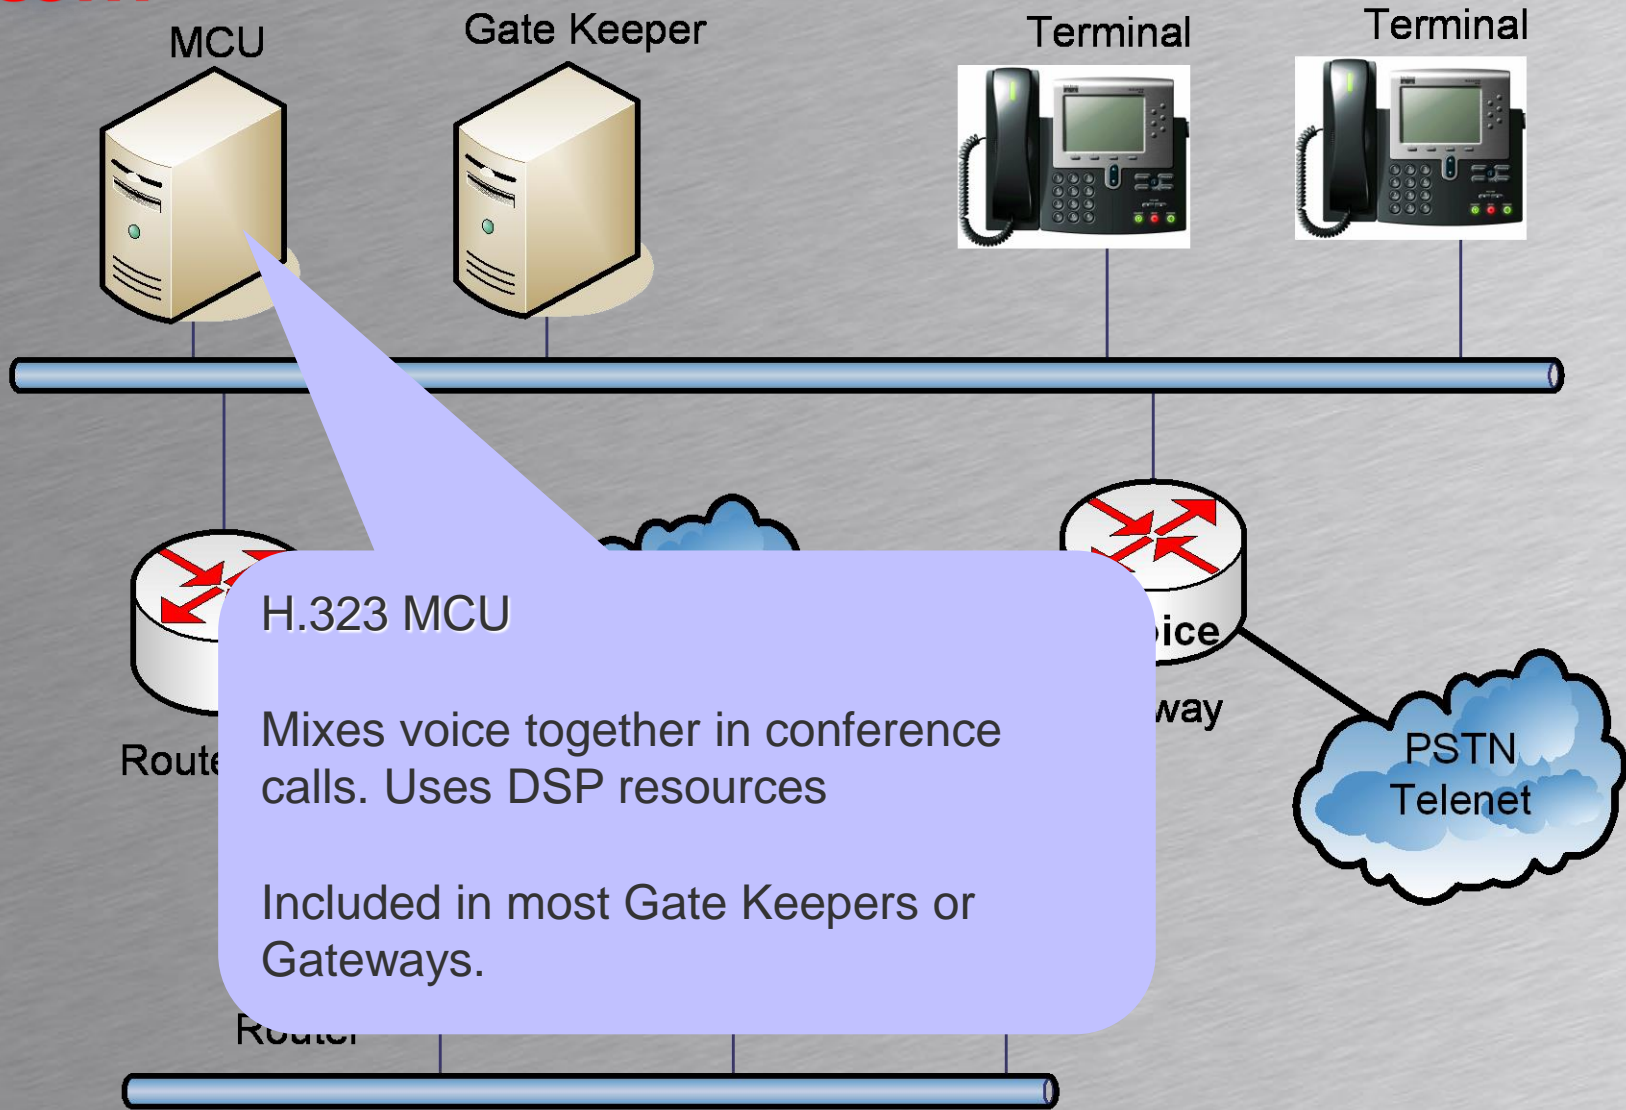

# H.323: Gateway

# H.323: Multi-point Control Unit

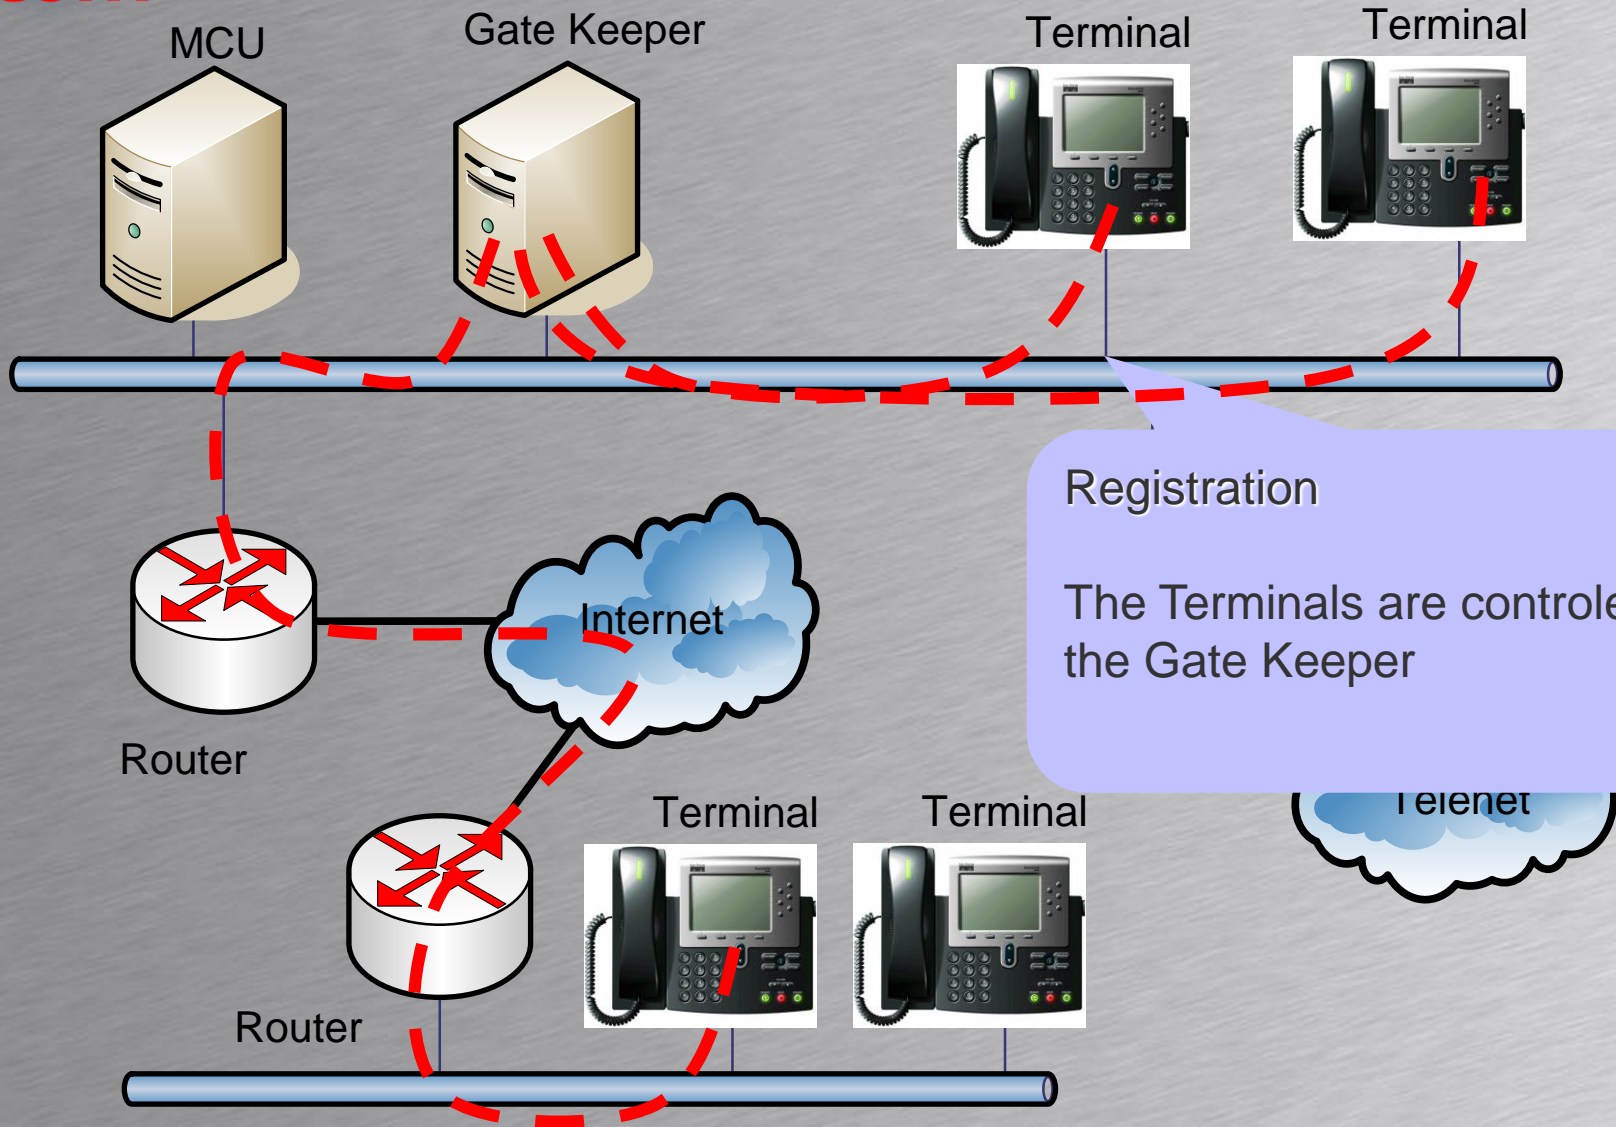

**H.323 MCU**

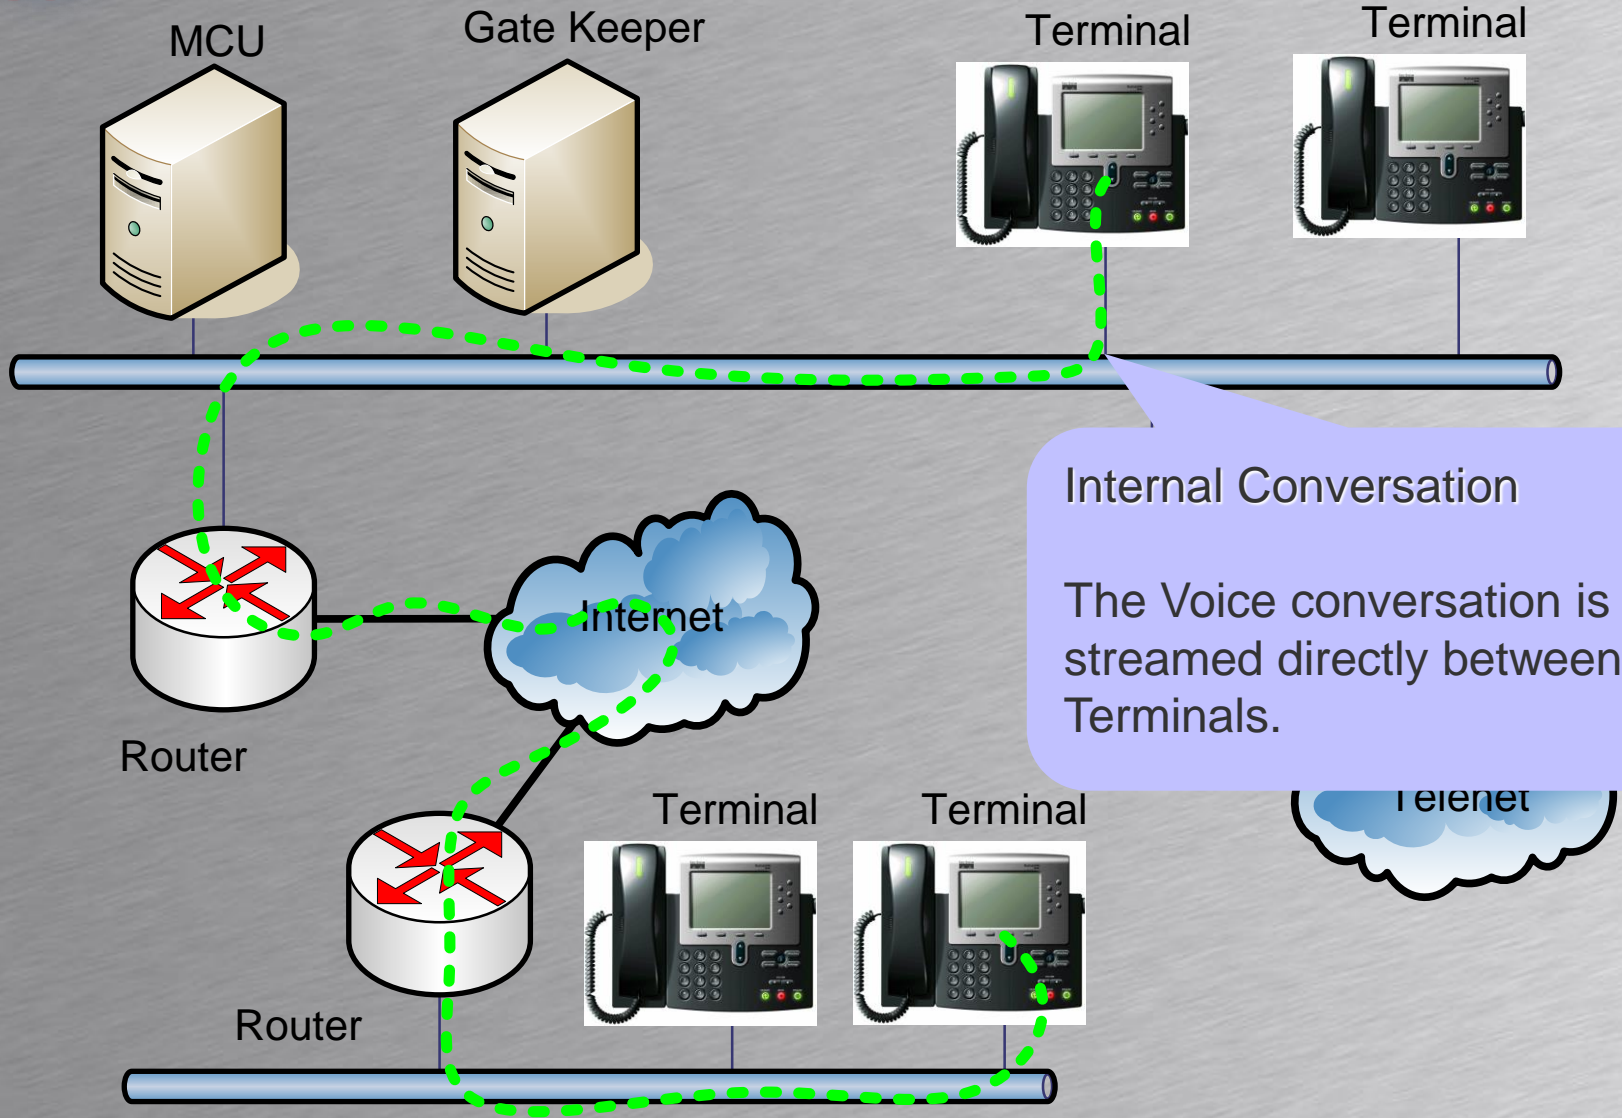

Mixes voice together in conference calls. Uses DSP resources

Included in most Gate Keepers or Gateways.

# Gatekeeper controls the terminals

# Gatekeeper controls the terminals

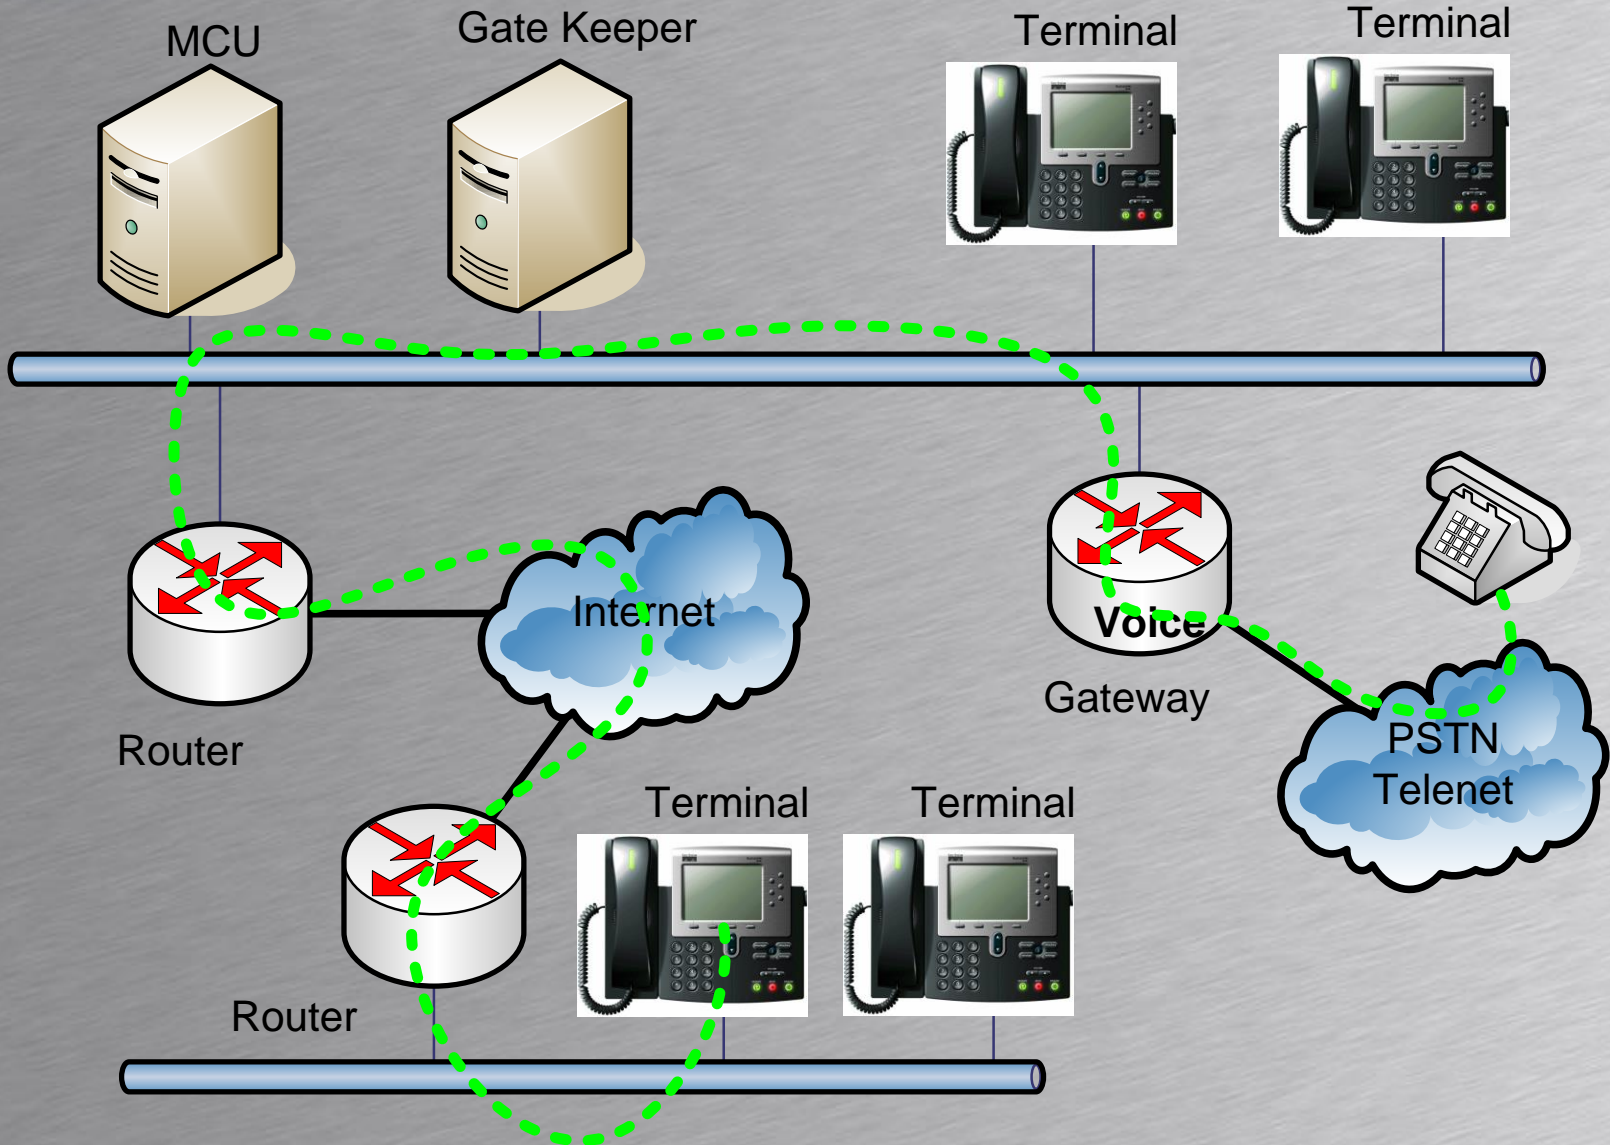

Internal Conversation

The Voice conversation is streamed directly between Terminals.

Internet

# Terminal to Gateway

# WIRESHARK

Packet analyzer

# Wireshark

- Wireshark is free and open source network packet analyzer
- Captures packets from wired or wireless networks for analyze
- Useful for troubleshooting
- Useful for understanding protocols
  - Primary use in this course module
- Download from <http://www.wireshark.org/>

# Capturing packets

The screenshot shows the Wireshark Network Analyzer interface. The 'Capture' menu is open, and the 'Interfaces...' option is selected and circled in red. A dialog box titled 'Wireshark: Capture Interfaces' is overlaid on the main window. In this dialog, the 'Start' button is circled in red. A blue callout box with a white border contains the following text:

**3: Select Start to capture**

Note – you may stop capturing at any time selstcing Capture->Stop

The dialog box also shows a list of network interfaces with checkboxes, a 'Packets/s' column, and buttons for 'Details', 'Start', 'Stop', 'Options', and 'Close'.

# Capturing packets

**Field 1:** Packet summary window. Shows a list of captured packets. Fx packet 47 is a TCP

No.	Time	Source	Destination	Protocol	Length	Info
44	29.814947000	192.168.1.1	192.168.1.1	TCP	54	59211 > compaq-wc
45	29.816922000	192.168.1.1	192.168.1.1	TCP	54	59211 > compaq-wc
46	29.827328000	192.168.1.1	192.168.1.1	TCP	54	59211 > compaq-wc
47	29.827465000	192.168.1.1	192.168.1.1	TCP	54	59211 > compaq-wc
48	29.828828000	192.168.1.1	192.168.1.1	TCP	54	59211 > compaq-wc
49	29.828856000	192.168.1.1	192.168.1.1	TCP	54	59211 > compaq-wc

**Field 2:** Packet details window. Shows details of selected packet in the packet summary windows. In this case packet/frame 47

**Field 3:** Packet bytes window. Shows the raw packet captured in hexa-decimal and ASCII on the right. In this case packet/frame 47

```

# Packet filters

SIP packet filter –showing all SIP packets

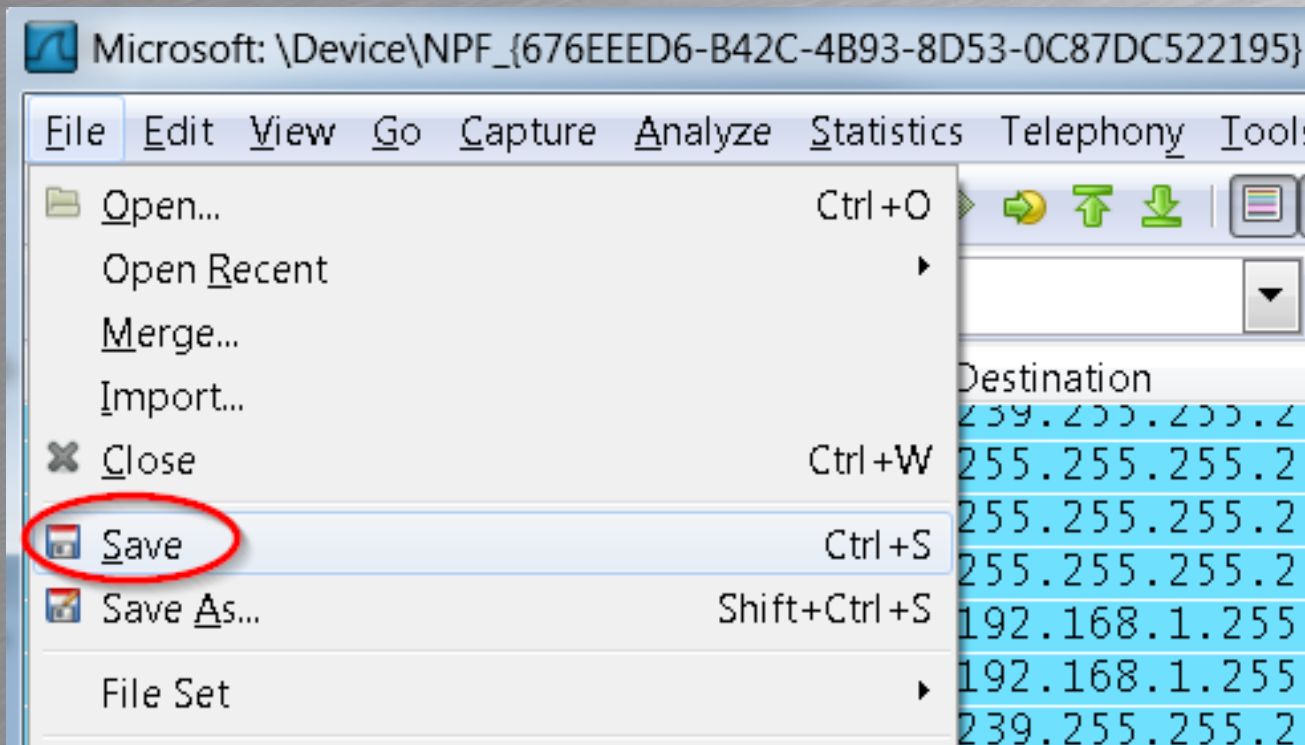

The screenshot shows a network traffic analysis tool interface. At the top, there is a toolbar with various icons for file operations, navigation, and search. Below the toolbar, a filter input field contains the text 'sip'. To the right of the filter field are buttons for 'Expression...', 'Clear', 'Apply', 'Save', and 'New'. Below the filter field is a table of captured packets. The table has columns for 'No.', 'Time', 'Source', 'Destination', 'Protocol', 'Length', and 'Info'. The packets listed are all SIP-related, including INVITE, ACK, and 200 OK messages.

No.	Time	Source	Destination	Protocol	Length	Info
15	4.321343	172.24.198.252	192.168.22.214	SIP/SDP	1016	Request: INVITE sip:

# Saving captured packets

- When troubleshooting you can save captured packets and mail to expert
- Collect information for later analyze

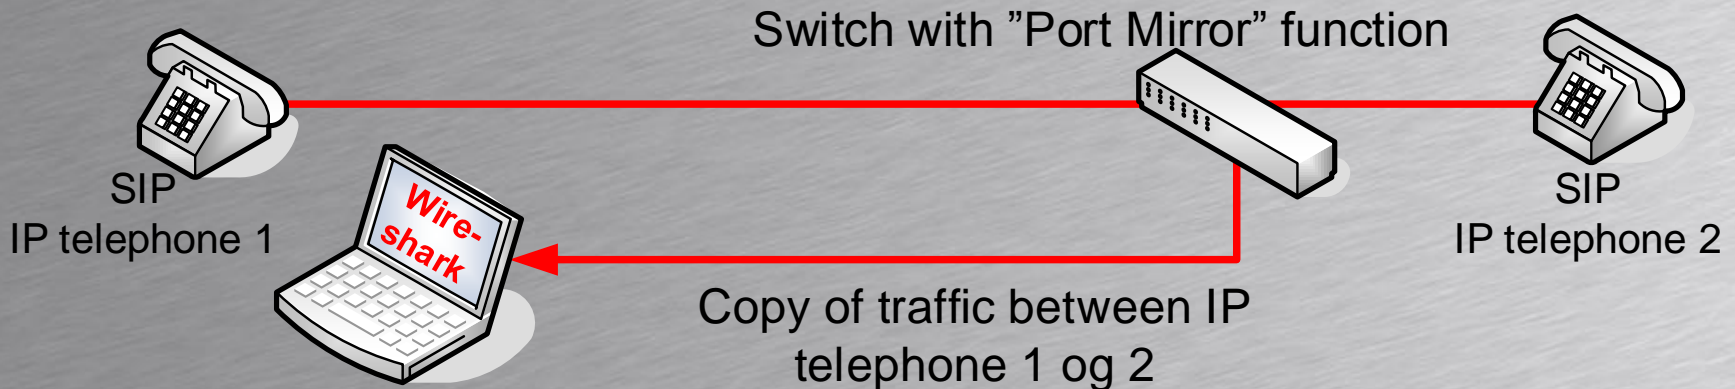

# Access to packets

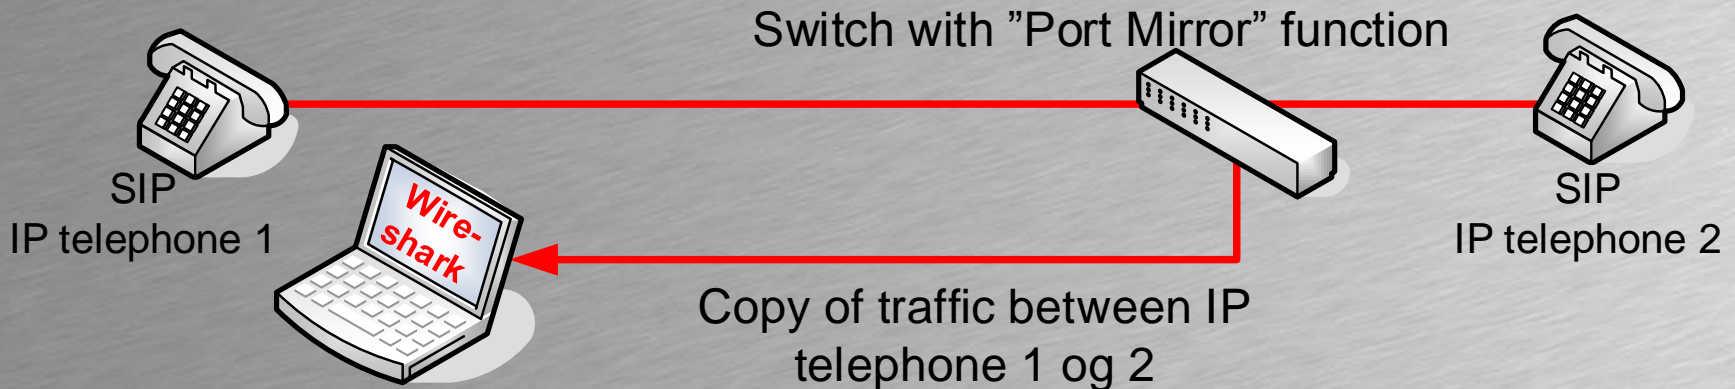

- For Wireshark to capture the packets – the packets must be received by your PC
  - Wired or wireless
- Capturing wired traffic may require additional setup

# Mirror function

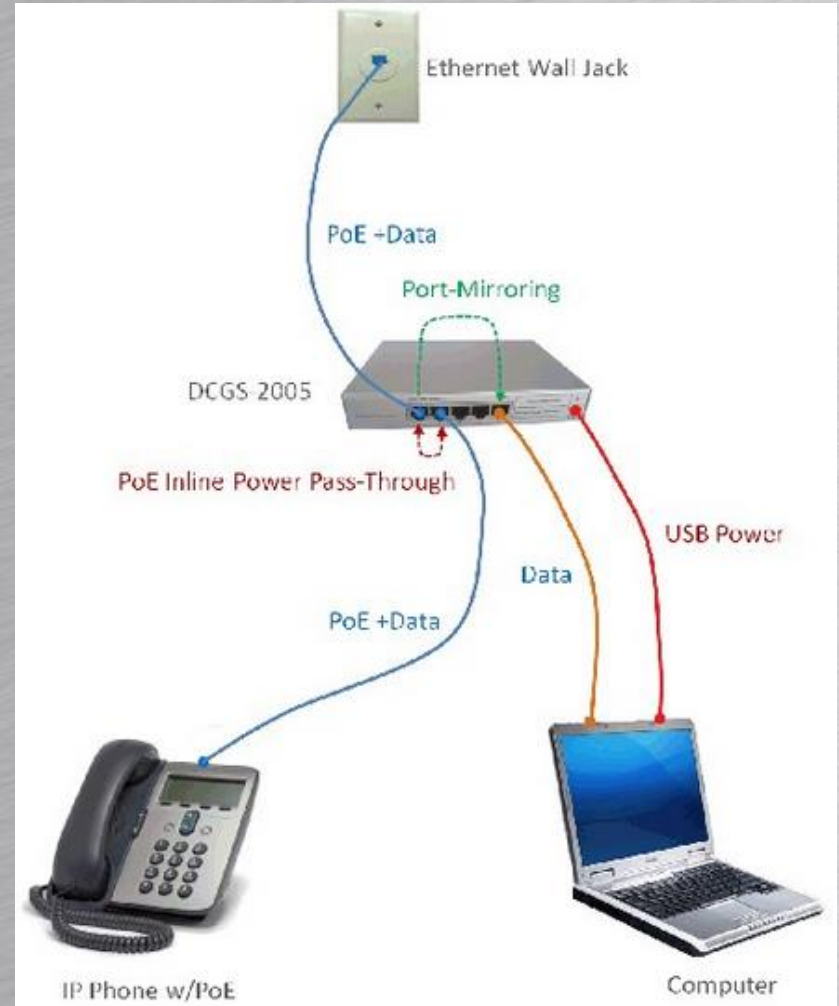

- Not all switches support mirror function
  - Zyxel name: Port mirroring
  - 3COM name: Roving Analysis Port (RAP)
  - Cisco name: Switched Port Analyzer (SPAN)

# Network tap

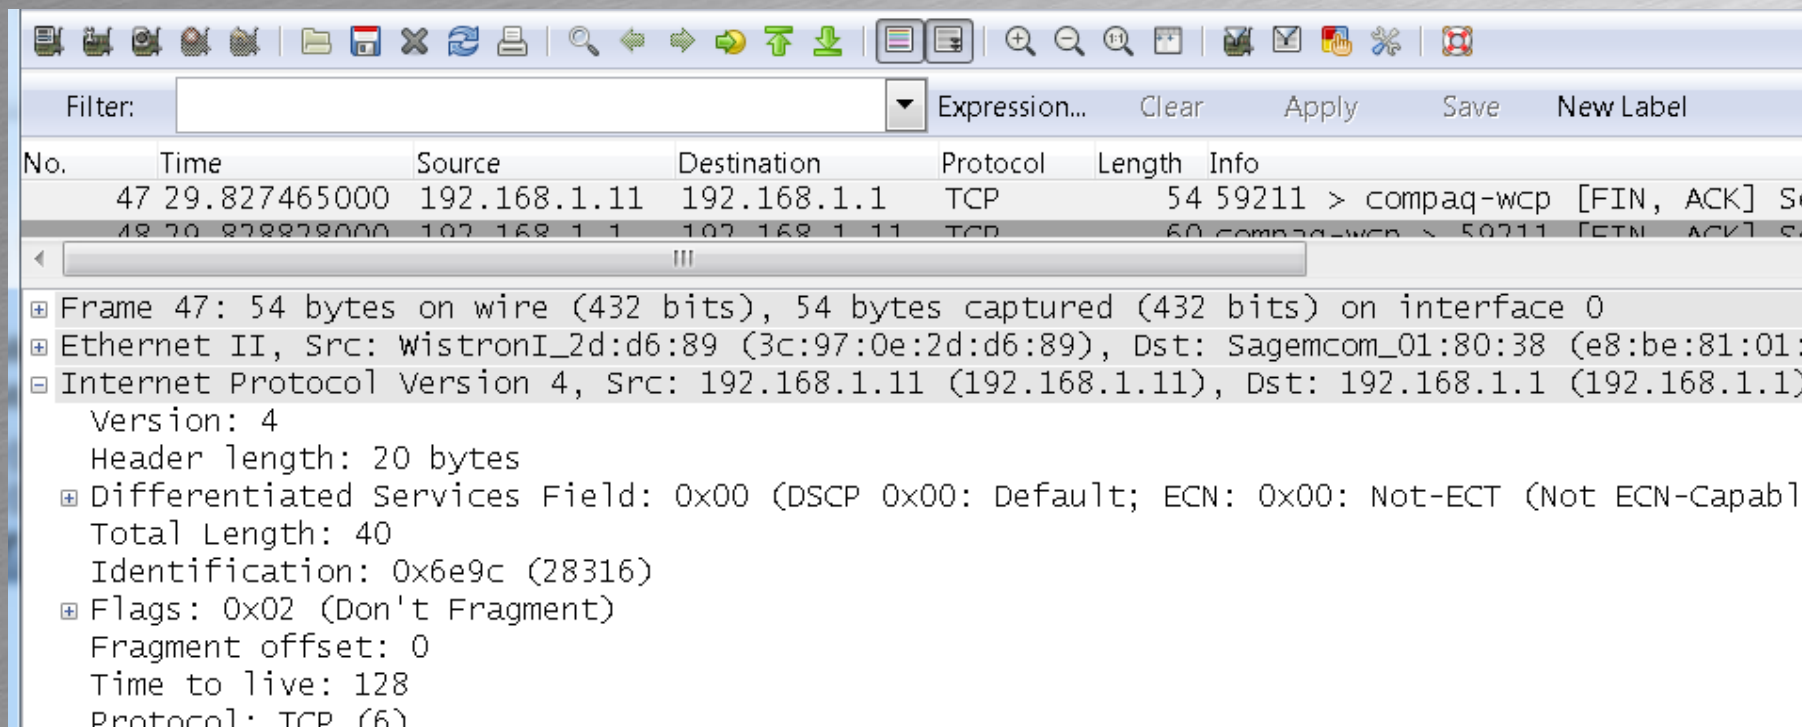

- A small dedicated switch with build in mirroring
- Example from
  - Dualcomm
  - DCGS-2005

# Task

- Capture SCCP and RTP Packets from the phone
- Create a visual document explaining the packets and the flow in a conversation.

The screenshot shows a network traffic analysis tool interface. At the top, there is a toolbar with various icons for file operations, search, and navigation. Below the toolbar is a filter bar with a text input field and buttons for 'Expression...', 'Clear', 'Apply', 'Save', and 'New Label'. The main area displays a list of captured packets with columns for 'No.', 'Time', 'Source', 'Destination', 'Protocol', 'Length', and 'Info'. The first two packets are highlighted in grey. Packet 47 is selected, and its details are shown in a tree view below the list. The details for packet 47 include:

- Frame 47: 54 bytes on wire (432 bits), 54 bytes captured (432 bits) on interface 0
- Ethernet II, Src: WistronI\_2d:d6:89 (3c:97:0e:2d:d6:89), Dst: Sagemcom\_01:80:38 (e8:be:81:01:80:38)
- Internet Protocol Version 4, Src: 192.168.1.11 (192.168.1.11), Dst: 192.168.1.1 (192.168.1.1)
  - Version: 4
  - Header length: 20 bytes
  - Differentiated Services Field: 0x00 (DSCP 0x00: Default; ECN: 0x00: Not-ECT (Not ECN-Capable)))
  - Total Length: 40
  - Identification: 0x6e9c (28316)
  - Flags: 0x02 (Don't Fragment)
  - Fragment offset: 0
  - Time to live: 128
  - Protocol: TCP (6)
